

Model-based optimization of rituximab dosing regimen in follicular non-Hodgkin lymphoma

D. Ternant, E. Hénin, G. Cartron, M. Tod,
G. Paintaud, P. Girard

Introduction

Objectives

Introduction

■ Rituximab in follicular lymphoma

- Rituximab : Monoclonal antibody targeted against human CD20
- Large variability of concentration-effect relationship due to:
 - Pharmacokinetic variability : efficacy $\nearrow$ for concentrations $\nearrow$
 - *FCGR3A* polymorphism: **Progression-free survival (PFS) *FCGR3A-VV* > *F* carriers**

(Igarashi et al. 2002)

- Proportions VV (15%) – Fx (85%)
(Lejeune et al. 2009)

Introduction

Objectives

- Initial dosing regimen : induction treatment by 4 weekly 375 mg/m² injections
- ↗ number of injections, maintenance treatment:
↗ PFS

- **The dosing regimen may be optimized:**
 - Increasing infusion dose
 - Adjusting dosing regimen according to *FCGR3A* genotype
 - But not confirmed by specific studies
- **Clinical trial simulation**
 - But... No PK-PD study of rituximab in FL

Objectives

- **Build and evaluate a dose – efficacy model of rituximab in follicular lymphoma**
 - Using data from literature
 - Considering *FCGR3A* genotype
- **Simulate dose – efficacy relationship for several dosing regimens**

Time-to-event simulation model

Time-to-event model

$$PFS(t) = \exp(-\lambda \cdot t)$$

$$\lambda = \lambda_{\max} \cdot \left(1 - \frac{Cm^\gamma}{Cm_{50}^\gamma + Cm^\gamma} \right)$$

$$Cm_{t_n-t} = \frac{AUC_{t_n-t}}{t_n - t} = \frac{\int_{t_n}^t C(\tau) d\tau}{t_n - t}$$

- λ : hazard function
- $\lambda_{\max}$: maximum hazard (no rituximab efficacy)
- Cm : mean-time concentration
- Cm_{50} : Cm leading to 50% of $\lambda_{\max}$
- γ : shape factor

Objectives

Model building

Model evaluation

Time-to-event model

- Time-to-event model: parameter estimation
 - Cm_{50} , γ : estimated
 - Median pharmacokinetics (Cm , *Berinstein, 1998*)
 - PFS (*McLaughlin, 1998*)

Objectives

Model building

Model evaluation

Influence of *FCGR3A*

Data

Berinstein,
1998

- 2 compartment model

Estimation

– $\lambda_{\max}$, Cm_{50} , γ

Estimation

– $Cm_{50,VV}$, $Cm_{50,Fx}$
– γ_{VV} , γ_{Fx}

Time-to-event simulation model

Objectives

Model building

Model evaluation

Influence of *FCGR3A*

- γ values for VV and Fx were fixed:
 $\gamma_{Fx} = \gamma = 0.5$. $\gamma_{VV} = 2$
- Estimation of $Cm_{50,VV}$ and $Cm_{50,Fx}$
 - PFS_{VV} and PFS_{Fx} (24 months) *Weng, 2004*.
 $HR_{Fx/VV} = 2.5$
 - *McLaughlin, 1998*:
$$\lambda_{Fx,M24} = \hat{\lambda}_{M24} \times HR_{Fx/VV}^{1-0.85}$$
$$\lambda_{VV,M24} = \hat{\lambda}_{M24} / HR_{Fx/VV}^{1-0.15}$$
 - Then calculation of $Cm_{50,VV}$ and $Cm_{50,Fx}$ by solving the equations:

$$PFS_{\text{genotype}}(24M) = f(Cm_{50,\text{genotype}})$$

Ng, 2005
Population PK
parameters

Time-to-event simulation model

$\omega_{Cm50} = 50\%$

Simulation model

■ Simulation of published studies

- Number of patients = eligible patients of the study
- Number of simulations = 500
- Evaluation: visual predictive checks (VPC)
 - { observed PFS
 - { model-predicted PFS (90% confidence interval)
- *Trial simulator II.2, S-Plus 6.2*

Dose alteration

Internal evaluation

- Pivotal study (*McLaughlin et al. 1998*)

Model Building

Model evaluation

Dose alteration

Internal evaluation

- Influence of *FCGR3A* genotype : *Weng et al. 2004*

Model Building

Model evaluation

Dose alteration

External evaluation

External evaluation

■ Studies

- *Van Oers et al. 2006* :
PFS of relapsed/resistant FL patients treated with:
 - R-CHOP
 - R-CHOP + rituximab maintenance (375 mg/m² every 3 months)
- *Cartron et al., 2002* : PFS of first-line FL VV et Fx patients (rituximab 4 x 375 mg/m²)

Model Building

Model evaluation

Dose alteration

External evaluation

— *Van Oers et al.*

R-CHOP Without maintenance

6 * 375 mg/m²/21d

R-CHOP With maintenance

6 * 375 mg/m²/21d

+ 375 mg/m²/3months

Model Building

Model evaluation

Dose alteration

Model evaluation

- *Cartron et al., 2002*
 - 4 x 375 mg/m²/week.

Model Building

Model evaluation

Dose alteration

Conclusion: model

- **Satisfactory description of rituximab PFS within M24**
 - With and without rituximab maintenance
 - For both *FCGR3A* genotypes
- **PFS (M24) : metrics**

Dosing regimen alteration

- **Rituximab monotherapy** (*Cartron et al. 2002*) : Fx vs. VV
 - 4 weekly doses + maintenance every 2 months
 - Dose alteration
 - Induction : 375, 750, 1500, 2250 mg/m²
 - Maintenance : 375, 750, 1500, 2250 mg/m²

Conclusion and perspectives

- **Main benefit : increase of maintenance dose**
- **PFS of Fx never reach PFS of VV**
- **Perspectives**
 - Improvement of the model : Tumor burden, stage of disease
→ alteration of induction dose and schedule
 - Confirmation by clinical trials

Time-to-event model

■ Parameter estimation

- $\lambda_{\max}$: fixed
 - Rituximab (R) combined with chemotherapy (X)

$$\lambda_{\max} = \lambda_X$$

- R alone

Effects for R and X are assumed to be independent

$$HR_{0/R} = HR_{X/R-X}$$

$$\lambda_{\max} = \lambda_R \times HR_{X/R-X}$$

$HR_{X/R-X}$: *Marcus et al., 2008*
