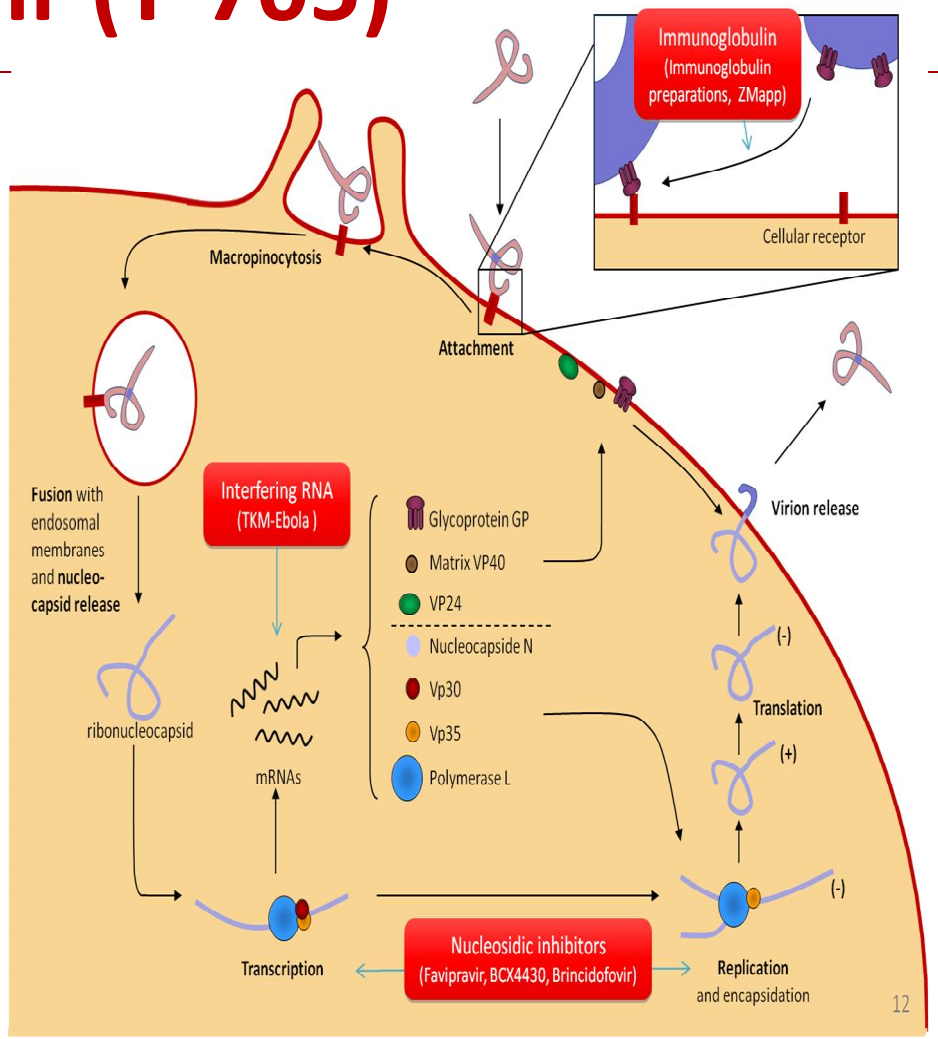
Favipiravir (T-705)

- **Treatment of Ebola Virus Disease**
  - Favipiravir: nucleoside polymerase inhibitor
  - Approved for use in influenza
  - Developed by Toyama Chemicals, Japan
  - Good tolerance
  - Was available in Oct 2014
  - In Ebola infected mice treated with favipiravir: 100% survival (vs 0% untreated)

(*Oesterreich et al, Antivir Res, 2014)*



Funded by the Horizon 2020 framework programme of the European Union

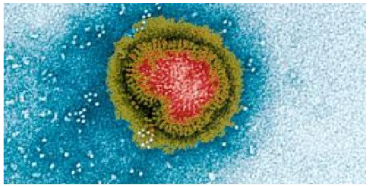
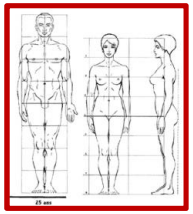
Dose of favipiravir in EVD adult patients?



- Favipiravir in influenza
  - IC50 of favipiravir 1 μg/ml
  - Protein binding 50%
  - Dosage regimen approved in Japan 1600mg/600mg bid for 4 days
  - Dosage regimen for Phase 3 trial in US 1800mg/800mg bid for 4 days
- Higher studied dose in HV
    - Single dose 2400 mg
    - Maintenance dose 600 mg tid

- Favipiravir in Ebola
  - IC50 of favipiravir 10 μg/ml
  - Mice successfully treated with dose of 150 mg/kg bid *per os*

➢ Dosage regimen in adult patients?



- IC50 rule: 10 times higher than for influenza = 8 g?
- Same dose/kg than in mice 150 x 70 = 10.5 g?

Funded by the Horizon 2020 framework programme of the European Union

REACTION!

Dose of favipiravir in EVD adult patients?

The Challenges of Design in Guinea in September 2014

Randomization, while providing the best level of evidence, is not always ethical or possible:

- Ethical arguments should be weighed against the risk/benefit ratio
  - Ebola mortality in Guinea was 60% in adults
  - Favipiravir had an excellent reported safety profile (less than 3% non-severe toxicity)
- RCTs were problematic for the community
  - terrified by the expanding epidemic
  - lacked trust in health-care workers and public authorities
  - informed consent to an RCT was not feasible

Are adaptive randomised trials or non-randomised studies the best way to address the Ebola outbreak in west Africa?

The Ebola outbreak that has devastated parts of west Africa represents an unprecedented challenge for research and ethics. Estimates from the past three decades emphasise that the present effort to contain the epidemic in the three most affected countries (Guinea, Liberia, and Sierra Leone) has been insufficient, with more than 24 900 cases and about 10 300 deaths, as of March 25, 2015. Faced with such an exceptional event and the urgent response it demands, the use of randomised controlled trials (RCT) for Ebola-related research might be both unethical and infeasible and that potential interventions should be assessed in non-randomised studies on the basis of compassionate use. However, non-randomised studies might not yield valid conclusions, leading to large residual uncertainty about how to interpret the results, and can also waste scarce intervention-related resources, making them profoundly unethical. Scientifically sound and rigorous study designs, such as adaptive RCTs, could provide the best way to reduce the time needed to develop new interventions and to obtain valid results on their efficacy and safety while preserving the application of ethical precepts. We present an overview of clinical studies registered at present at the four main international trial registries and provide a simulation on how adaptive RCTs can behave in this context, when mortality varies simultaneously in either the control or the experimental group.

RESEARCH ARTICLE

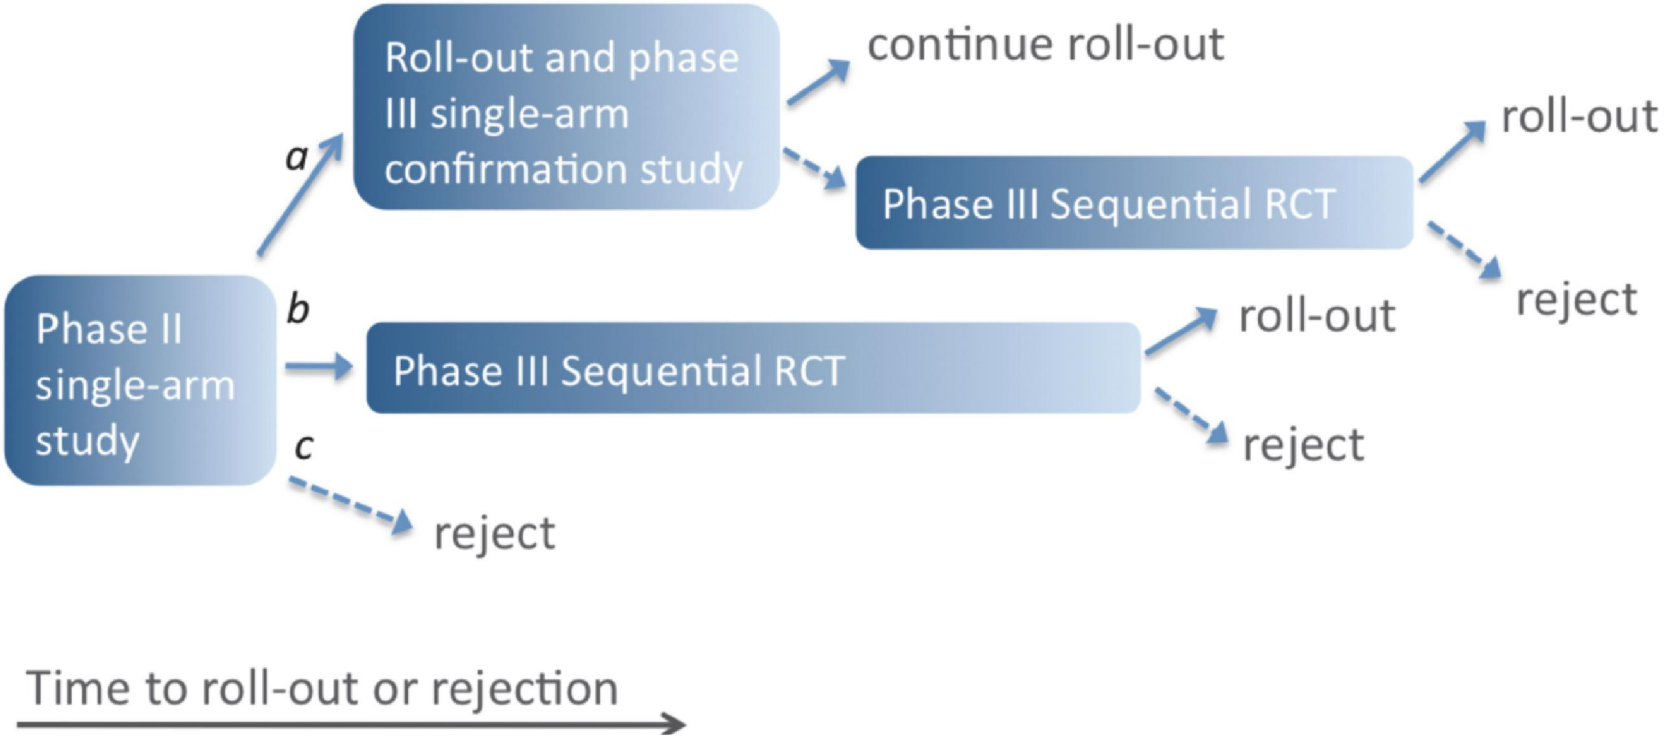
Evaluating Clinical Trial Designs for Investigational Treatments of Ebola Virus Disease

Ben S. Cooper[1,2]*, Maciej F. Boni[2,3], Wirichada Pan-ngum[4], Nicholas P. J. Day[1,2], Peter W. Horby[2], Piero Olliaro[2,5], Trudie Lang[2], Nicholas J. White[1,2], Lisa J. White[1,2], John Whitehead[6]

Design 1. RCT without interim analysis

Design 2. Sequential RCT (up to 20 interim analyses)

Design 3. Multi-stage approach (MSA)



JIKI trial protocol

- **Objective**: assess efficacy of high-dose favipiravir in decreasing mortality in humans with EVD
- **Design**: non-comparative, "proof-of-concept", phase II trial
- **Inclusion criteria:**
  - Age ≥1 year and weight ≥10 kg, informed consent, able to take oral medications
  - Positive EBOV PCR test (RT-PCR, Altona Diagnostics RealStar Ebolavirus RT-PCR Kit 1.0)
    → "cycle threshold"(*Ct*) value is inversely proportional to viral load :
    Ct=20 equivalent to 10^8 copies/ml; +3 cycles equivalent to -1 log
- **Treatment**
  - **Favipiravir**, Toyama Chemical Co., Ltd. Orally administered 200 mg tablets.
  - **Adults** [(1)]*:*
    → Day 0 (inclusion): H0: 2400 mg; H8: 2400 mg; H16: 1200 mg
    → Day 1 to Day 9: 1200 mg bid
  - **Children** [(2)]: according to body weight

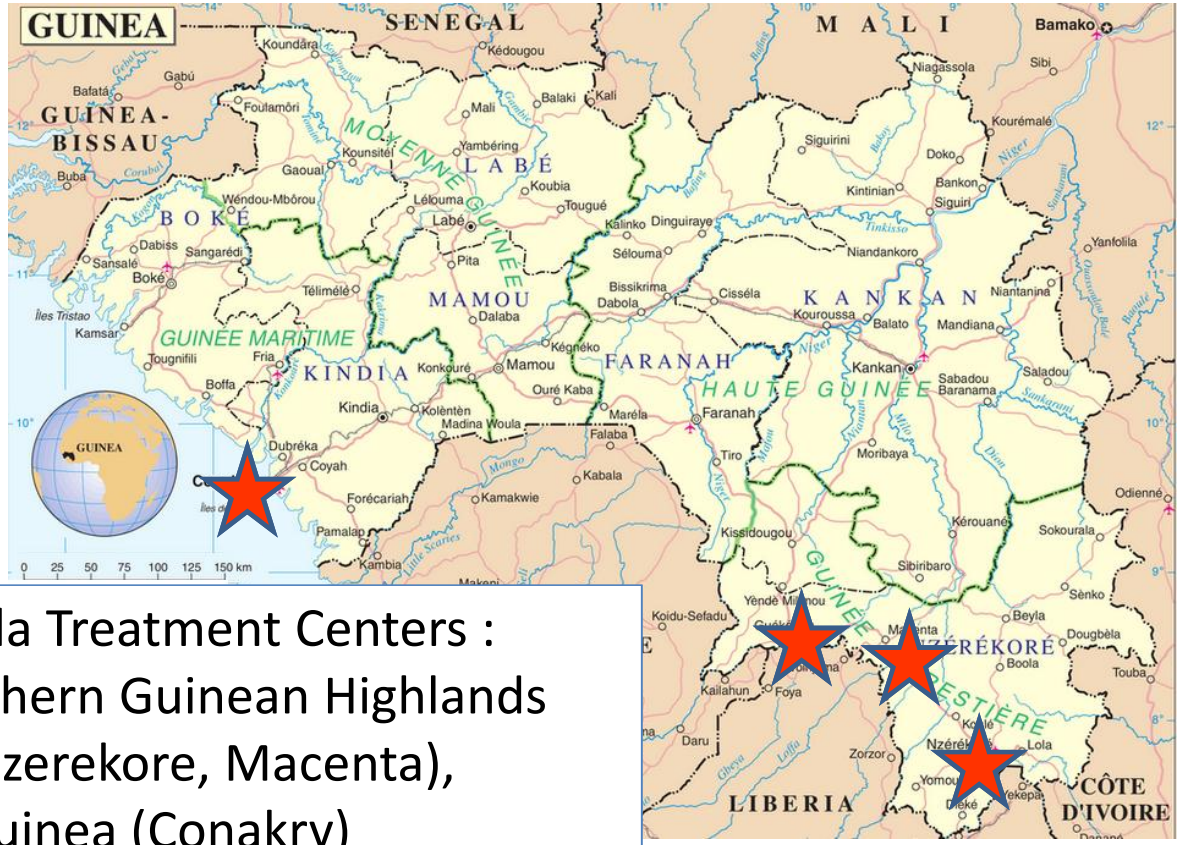
1. Mentre, Lancet Infect Dis 2014 ; 2. Frange, Lancet 2015

JIKI trial protocol

- **Primary outcome**: mortality at Day 14
- **Secondary outcomes**:
  - Evolution of EBOV plasma RNA and infectious loads
  - Grade 3-4 adverse events
  - EBOV genetic micro-diversity (including resistance mutations)
  - Trough concentrations of favipiravir
- **Analysis :**
  - **Reference:** Pre-trial mortality **55%** (MSF/EMLab database, Sept 15- Dec 14, 2015), **with same team, same procedures and same laboratory**
  - **Stratification variables**: Time since symptom onset: < 72h *vs.* ≥ 72h
- **Sample size calculation**:
  - Recruitment continues until 60 participants with <72h symptom duration are included (futility analysis every 20 patients)

Settings and teams

- **Funding**:
  - EU/H2020
  - Inserm
- **Partners**: Inserm, MSF, EuroMobLA, ALIMA, Pasteur, French Red Cross, B-FAST, French Army Health Service



Settings: 4 Ebola Treatment Centers :

- 3 in the southern Guinean Highlands (Gueckedou, Nzerekore, Macenta),
- 1 in costal Guinea (Conakry)

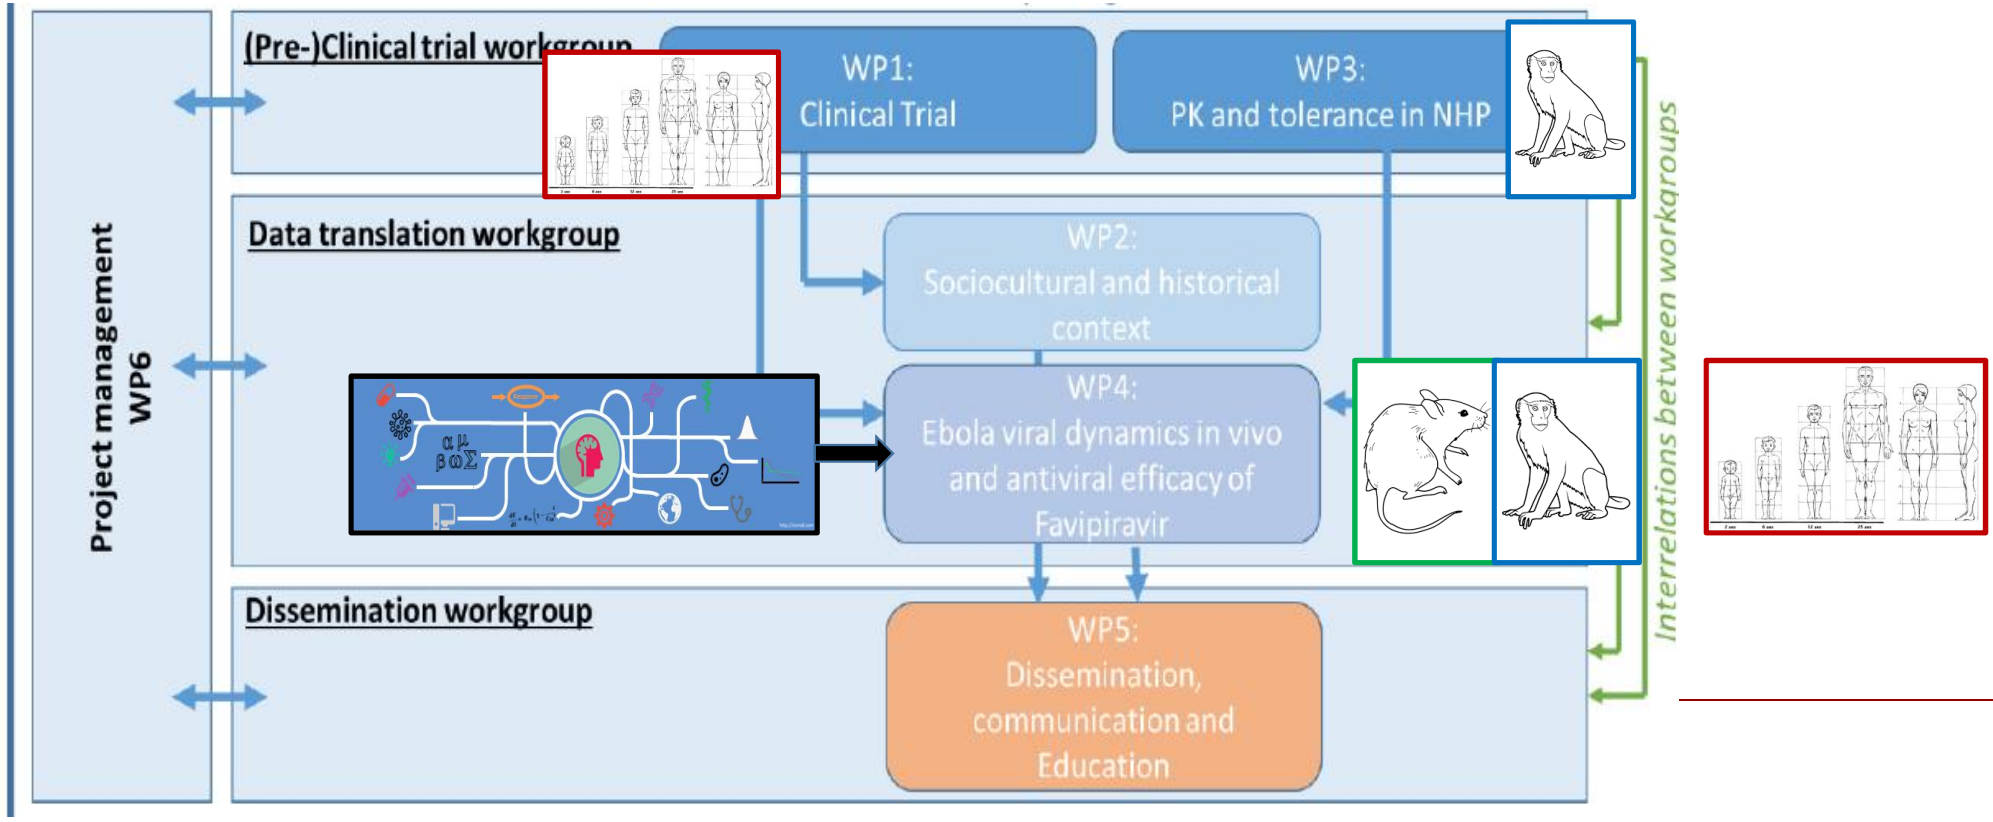
	N	Dead n	Dead %
Adults and children (> 6 yr) with CT ≥ 20	39	6	15.4
Adults and children (> 6 yr) with CT < 20	**28**	**26**	**92.9**

* 2 patients missing in JIKI for this classification because CT value at inclusion not available

REACTION!

Evaluation of efficacy and antiviral activity of favipiravir in non-human primates & humans

PI: Hervé Raoul, BSL4, INSERM,France



JIKI trial Surveillance

- SAB meetings : Nov 28, Jan 15, Jan 26
- DSMB meetings : Dec 11, Jan 5, Jan 14, Jan 26, April 14

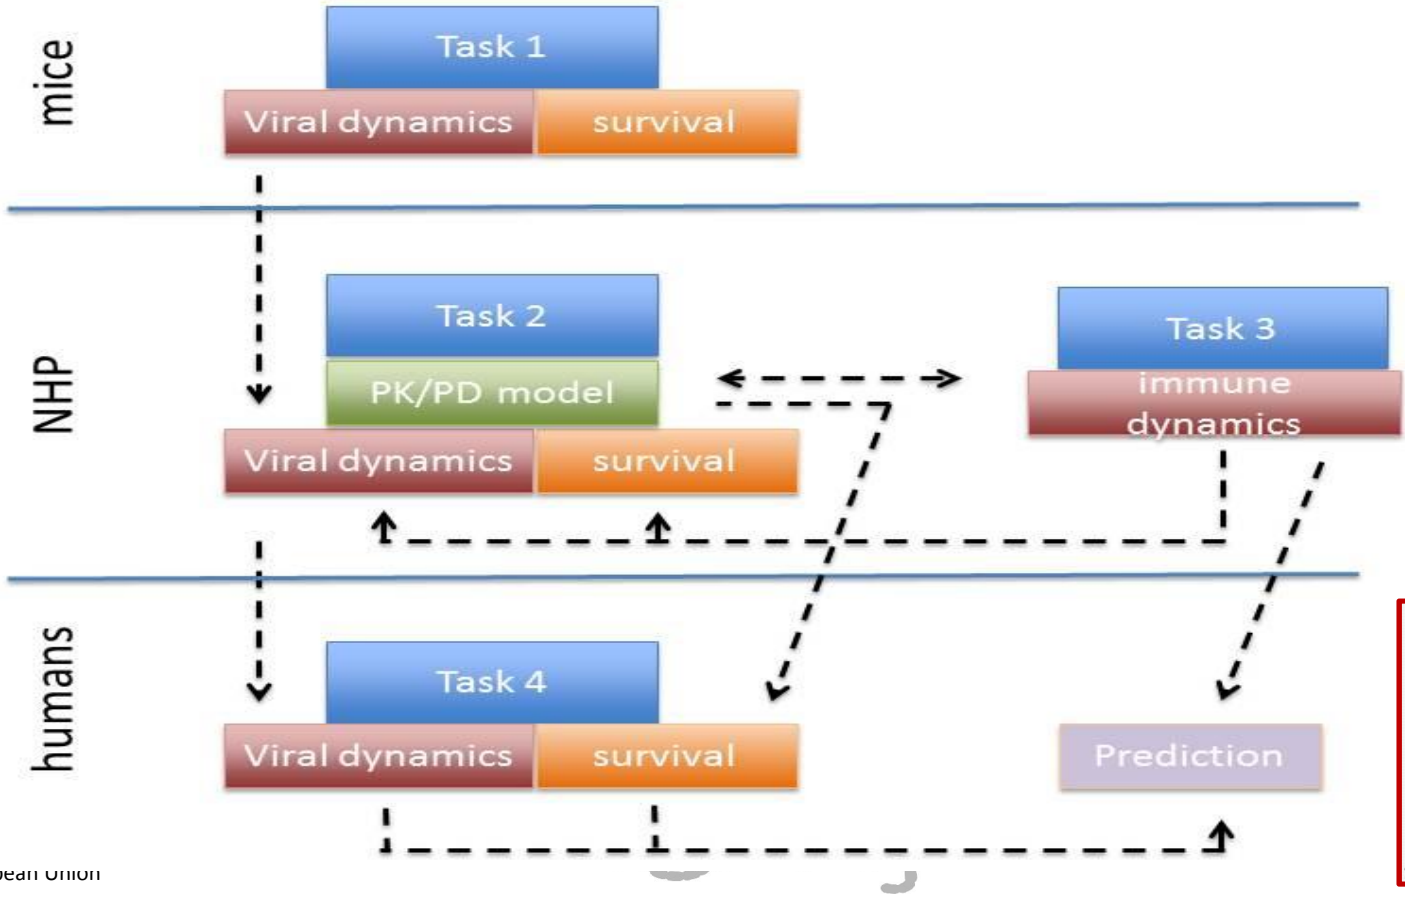
→ On Jan 26, the DSMB approved the investigators' proposal to make public data from the first 80 participants:

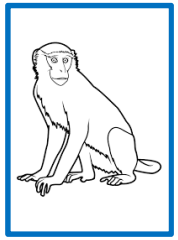
- **No conclusion regarding favipiravir effect on mortality reduction**
- **New understanding of EVD pronostic factors that may prove useful to clinicians and researchers developing Ebola treatment protocols**

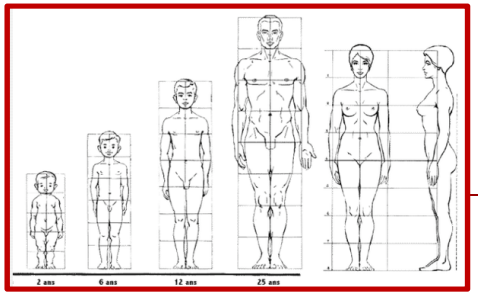
Results presented at CROI, Feb 23-26, 2015, Seattle, Washington

Sissoko et al. Favipiravir in Patients with Ebola Virus Disease: Early Results of the JIKI trial in Guinea, abs. 103-ALB

Modelling PKVK (WP4)







of the European Union

Objectives of Modelling

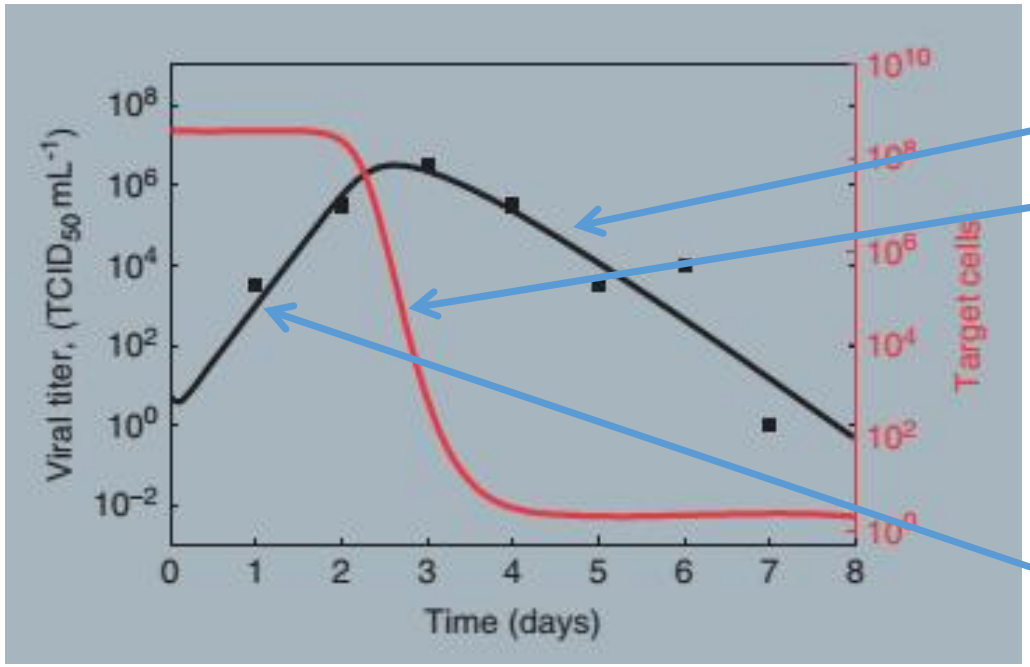
- To estimate important parameters of the viral lifecycle: infected cell half-life, basic reproductive number
- To estimate the effect of favipiravir in blocking viral production in animal and patients
- To quantify the effect of the immune response
- To investigate the relationship between viremia and survival

- To better understand clinical results and design next studies

Funded by the Horizon 2020
framework programme
of the European Union

Viral dynamics during acute infection

Complex interaction between the pathogen, the drug and the IR

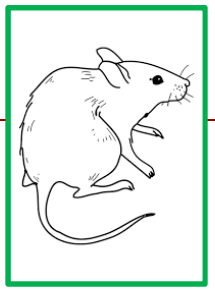


Clearance of infected cell due to:
- immune system
- cytolytic virus
- target cell exhaustion

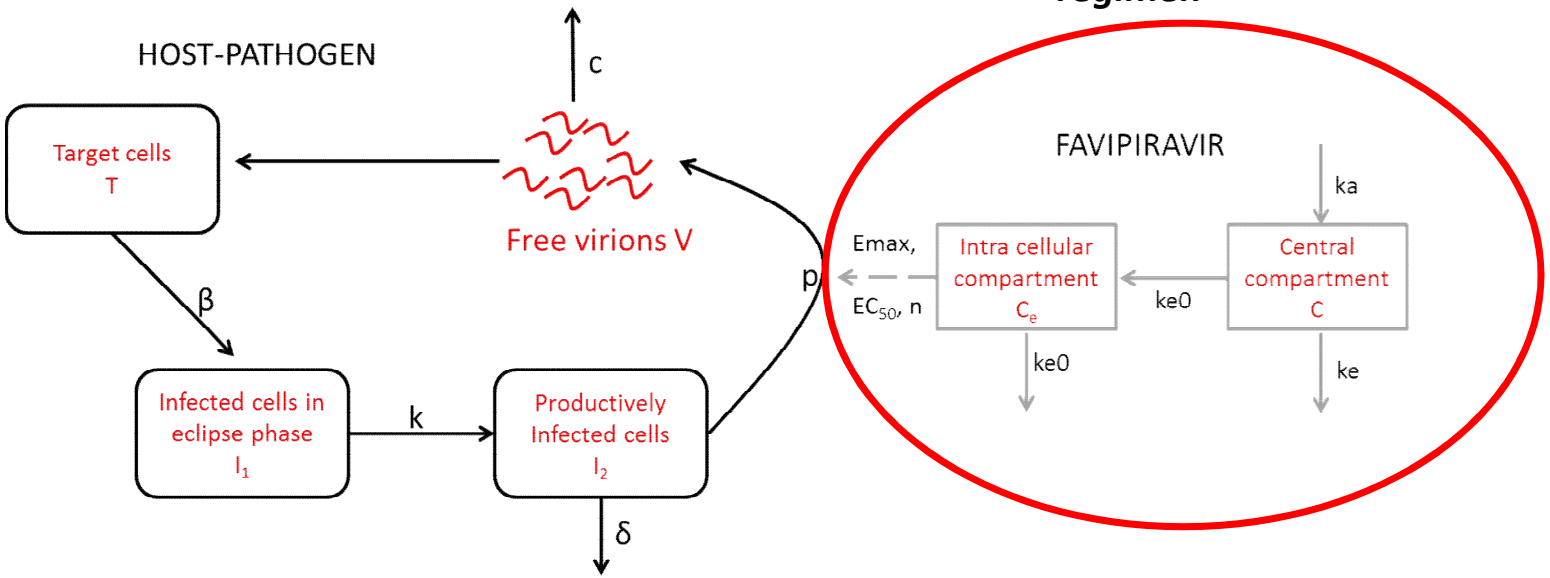
Viral increase:
- target cell abundance
- large viral burst (R_0)

Funded by the Horizon 2020 framework programme of the European Union

PKVK Model for favipiravir



Model for EBOV replication



Pharmacokinetic model based on data in uninfected mice receiving the same dosage regimen

$$\frac{dT}{dt} = -\beta VT$$

$$\frac{dI_1}{dt} = \beta VT - kI_1$$

$$\frac{dI_2}{dt} = kI_1 - \delta I_2$$

$$\frac{dA_c}{dt} = k_a \times A_{dep} - k_e \times A_c$$

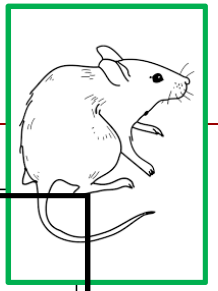
$$C = \frac{A_c}{V}$$

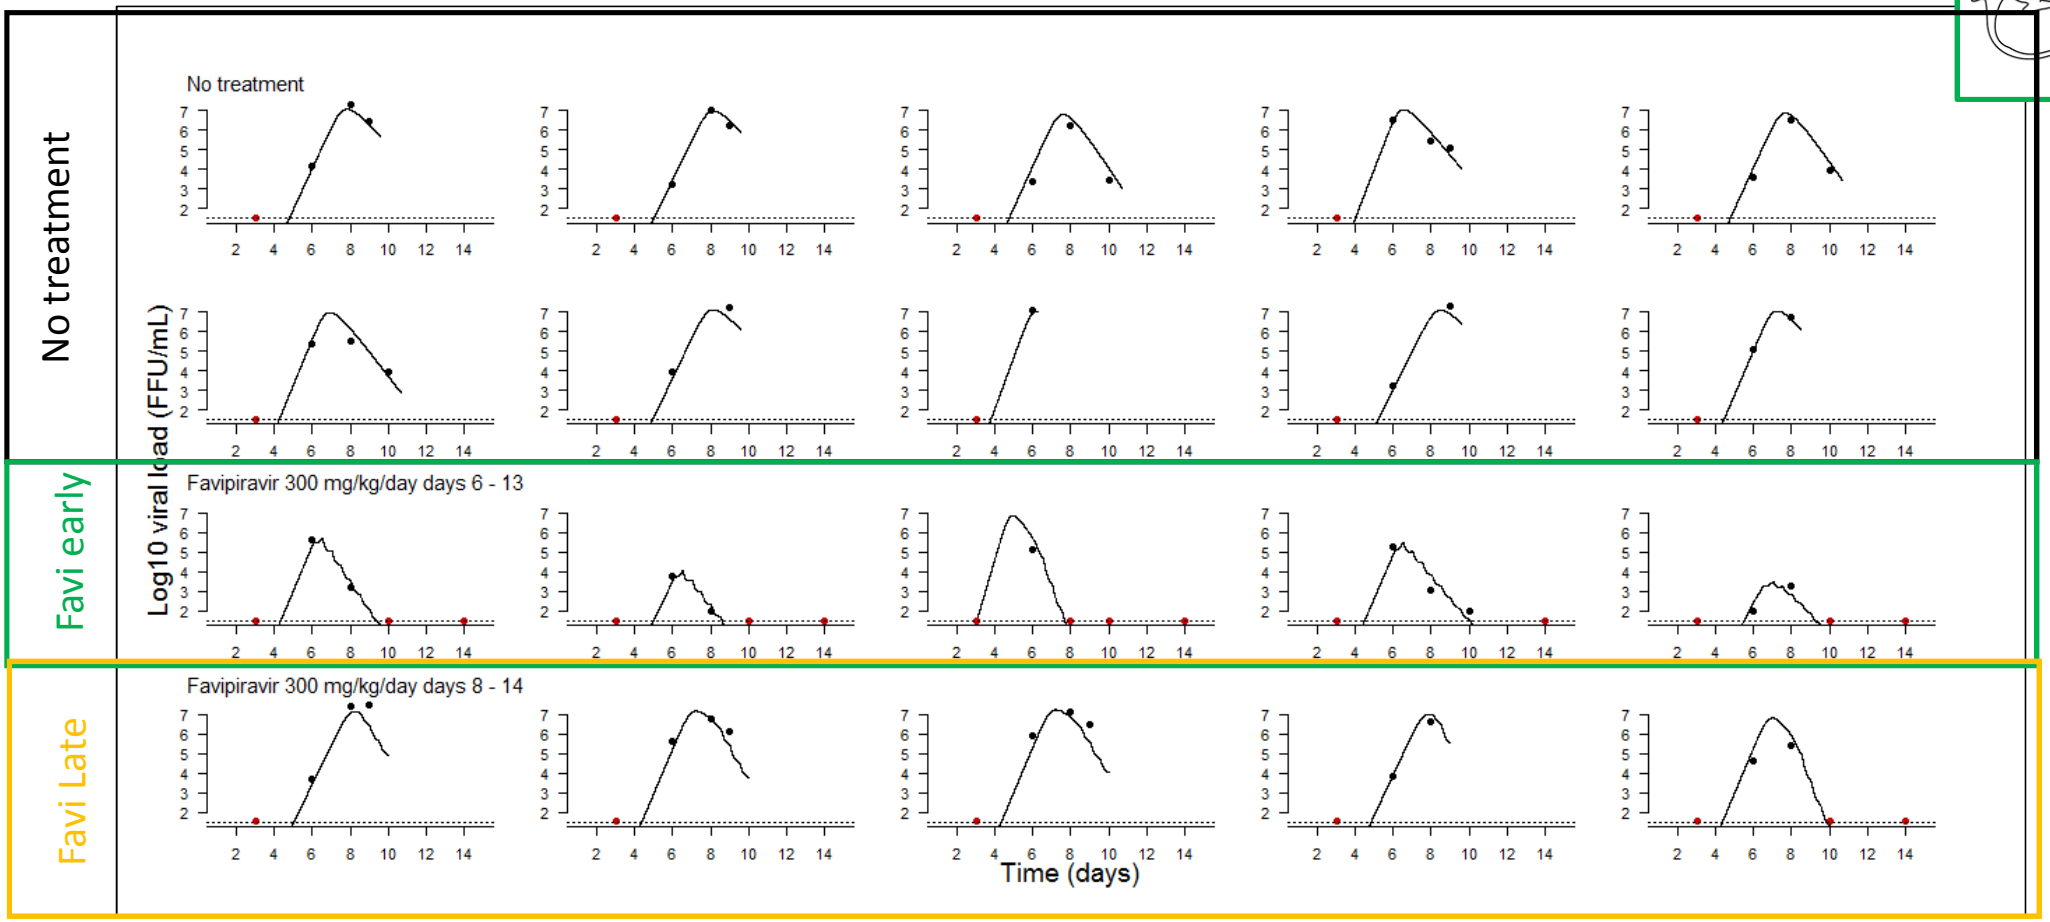
$$\frac{dC_e}{dt} = k_{e0} \times (C - C_e)$$

$$\frac{dV}{dt} = \left(1 - \frac{E_{max} C_e(t)^n}{EC_{50}^n + C_e(t)^n}\right) pI_2 - c_1 V$$

Funded by the Horizon 2020 framework programme of the European Union

Results: data fitting





Funded by the Horizon 2020
framework programme
of the European Union

REACTION!

Results: insights on pathogenesis

- $t_{1/2}$ productively infected cells of 6.4 hours (>10 hours for influenza)
- High steady-state effectiveness of favipiravir in blocking viral production (99.6%)
- A single infected cell could produce ~9 new productive infections (>20 in H1N1 or PR8-PB1-F2(1918))
