# Predicting late-phase outcome from early-phase findings using a model-based approach

*Application to Type 2 Diabetes Mellitus*

Roche

## Predicting the next phase in development

### Prediction of later phase from early phase data

- ⇒ Same biomarker in early and later phase  
(or later phase biomarker calculation of early phase biomarker)

## Predicting the next phase in development

What if biomarkers are not the same?

# Background Diabetes Mellitus

- Chronic disease with malfunctioning glucose control
- High blood glucose leads to nerve, kidney, and eye damages as well as cardio-vascular disease
- Glycation reactions occur proportional to level of blood glucose

# Background Biomarkers in Diabetes Mellitus

- Chronic disease with malfunctioning glucose control
- High blood glucose leads to nerve, kidney, and eye damages as well as cardio-vascular disease
- Glycation reactions occur proportional to level of blood glucose

**Early biomarkers: Glucose (and insulin)**

**Later biomarker: Glycosylated haemoglobin (HbA1c)**

# Background Biomarkers in Diabetes Mellitus

## Glucose (and insulin):

- Fast biomarker
- Highly variable
- Sensitive to food intake, circadian rhythm, etc.
  
- Typical use: phase 1
- Controlled diet settings
- Study duration: < 24 hrs

## HbA1c:

- Turn-over 2-3 months  
– life-spans of RBC
- Less variable
- Less sensitive
  
- Typical use: phase 2 and 3
- Normal diet settings
- Study duration: > 12 weeks

Can we use semi-mechanistic models to predict a later phase where HbA1c is measured for 12 weeks from an earlier phase where glucose is measured for 24 hours?

## Models for bridging biomarkers

Model describing glucose, daily variations and drug effects:  
Integrated glucose-insulin (IGI) model<sup>1, 2</sup>

Model linking glucose to glycation of red-blood cells:  
Integrated glucose-RBC-HbA1c (IGRH) model<sup>3</sup>

<sup>1</sup>Jauslin PM *et al* (2011) J Clin Pharmacol. 51: 153-64.

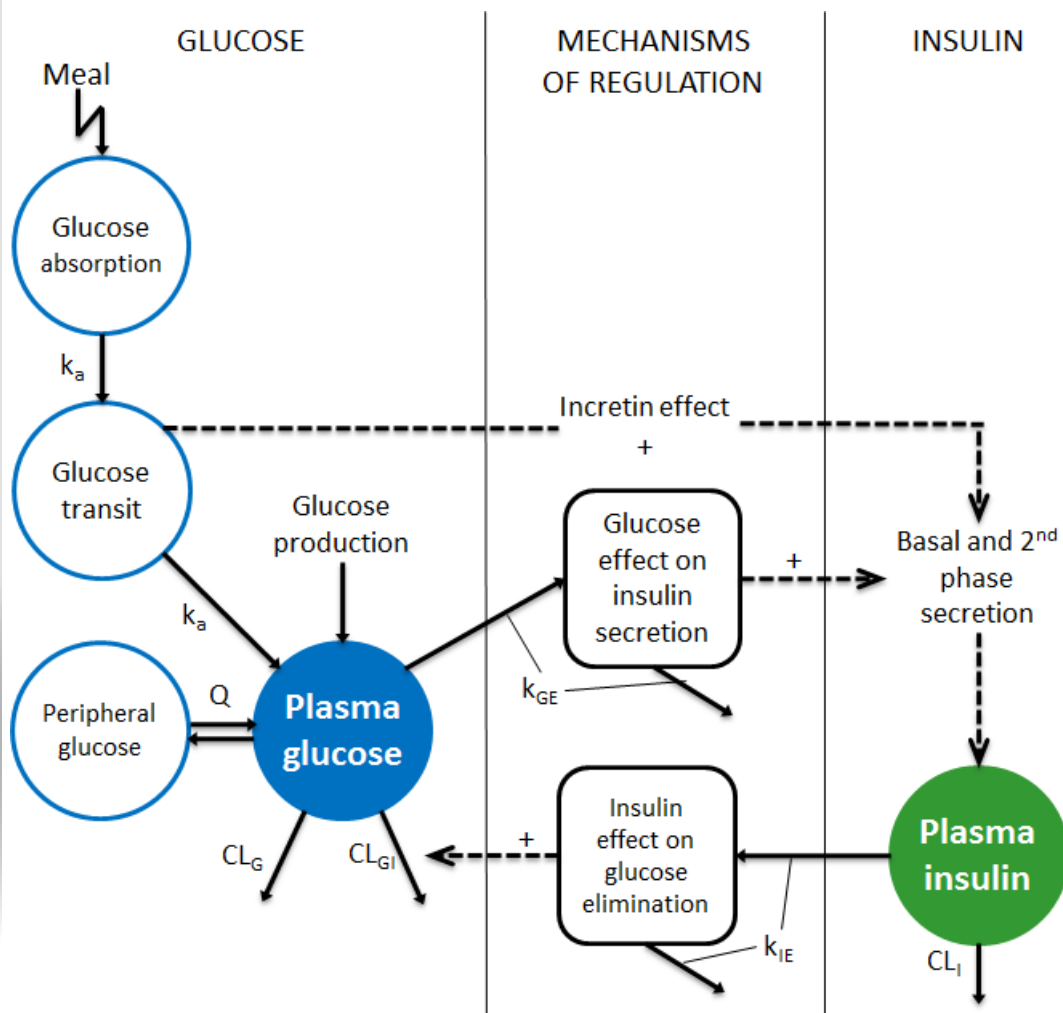

<sup>2</sup>Silber HE *et al* (2007) J Clin Pharmacol. 47: 1159-71.

<sup>3</sup>Lledo R *et al* (2010) PAGE 19: abstr: 1783.

## Integrated Glucose-Insulin (IGI) Model

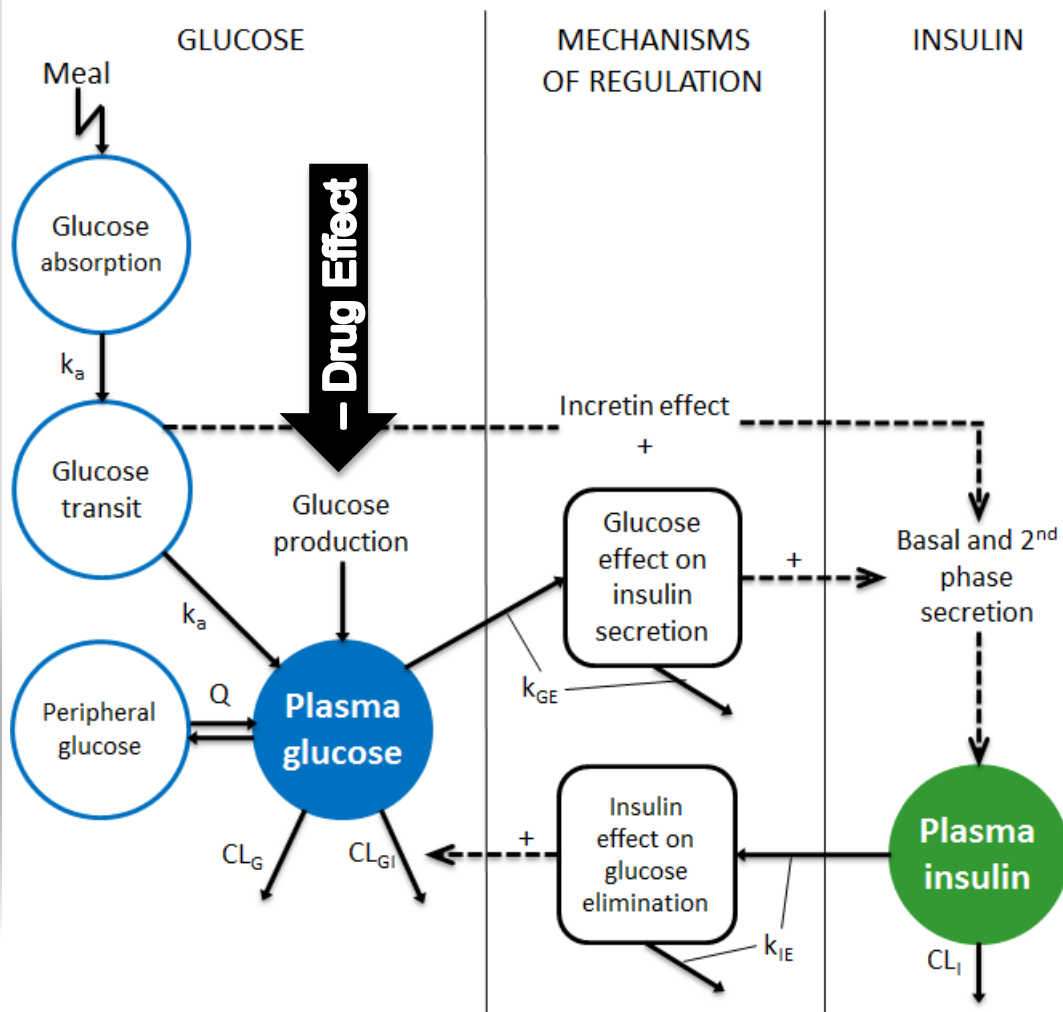

System-specific parameters  
E.g. distribution of glucose in peripheral tissue

Study-specific parameters  
E.g. baseline glucose and insulin

# Integrated Glucose-Insulin (IGI) Model

Drug effects can be added on parts of the model supported by mechanism of action.

**+ Drug Effect**

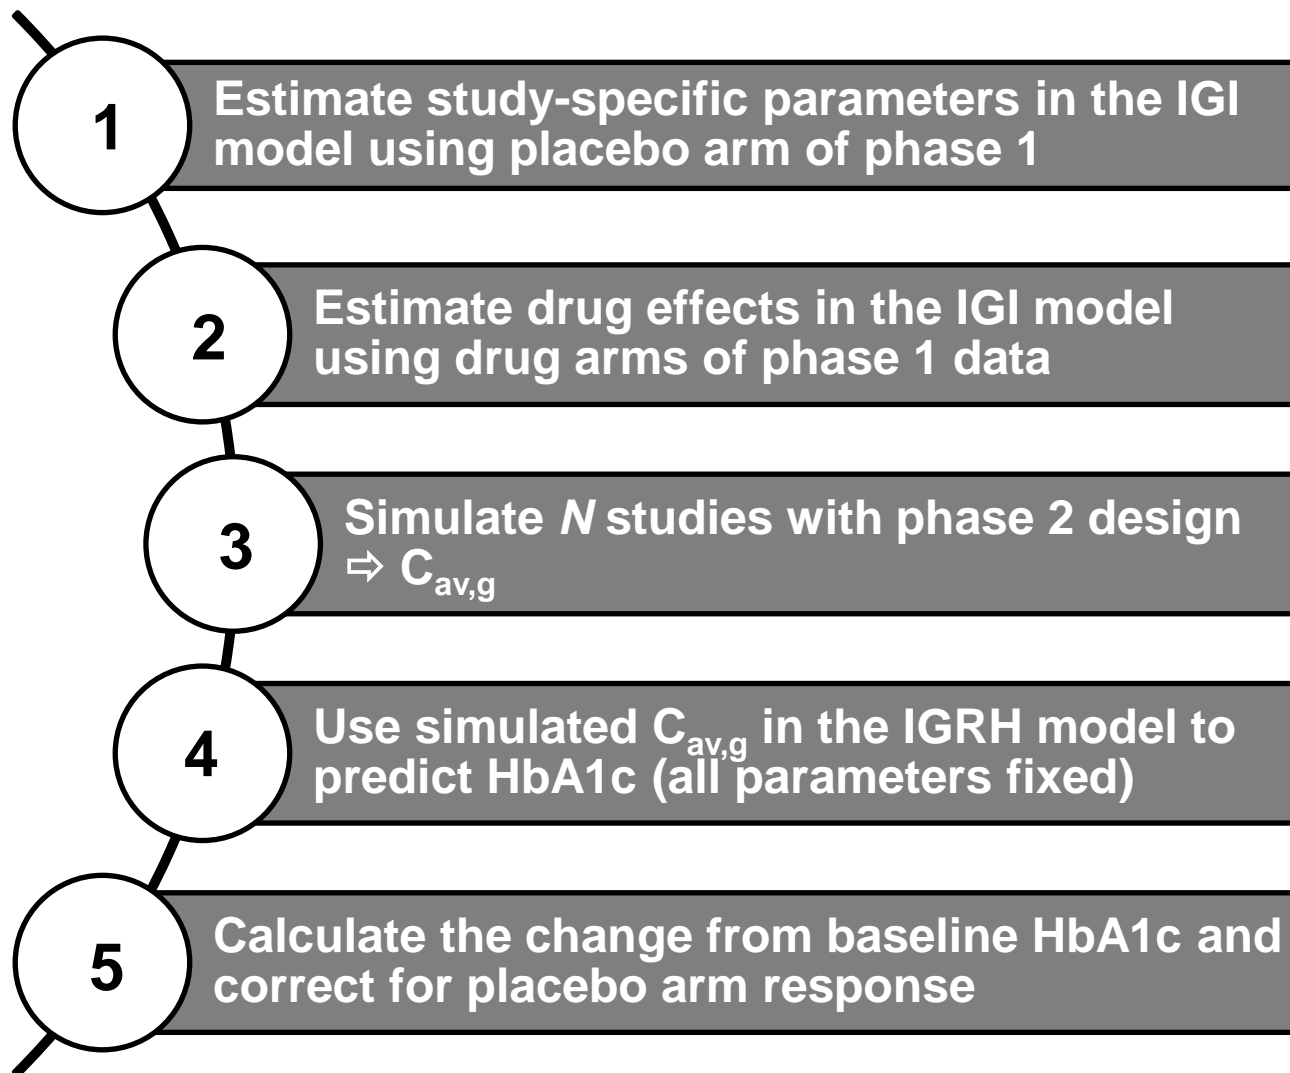

Glucokinase Activator (GKA)  
+ insulin secr.  
- glucose prod.

## Integrated Glucose-RBC-HbA1c (IGRH) Model

The IGRH model describes HbA1c as a function of average glucose concentrations and red blood cell life-spans, with RBC LS dependent on  $C_{av,g}$

### Data

#### Phase 1, PKPD:

- ☞ Measurements:  
**glucose** and **insulin**
- ☞ Meal tolerance tests
- ☞ Study duration: 1 week (3x24h)
- ☞ 59 Type 2 diabetics

- ☞ Parallel 7 arms  
(placebo, 10-200 mg QD/BID of GKA)

☞ FPG = 151 (24) mg/dL

☞ No metformin

### Design

#### Phase 2, dose finding:

- ☞ Measurements:  
**HbA1c**
- ☞ Normal diet
- ☞ Study duration: 12 weeks
- ☞ 210 Type 2 diabetics

- ☞ Parallel 6 arms  
(placebo, 25-100 mg QD/BID of GKA)

☞ FPG = 177 (34) mg/dL

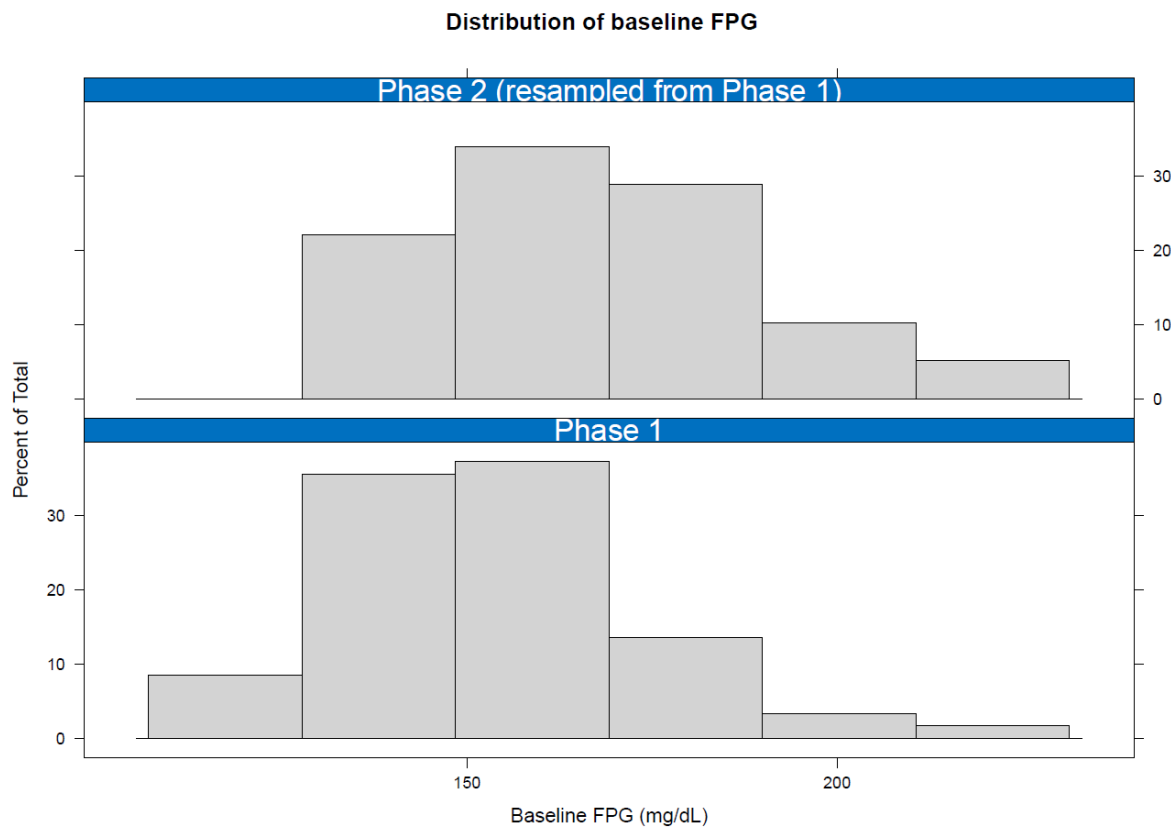

☞ Add-on to metformin

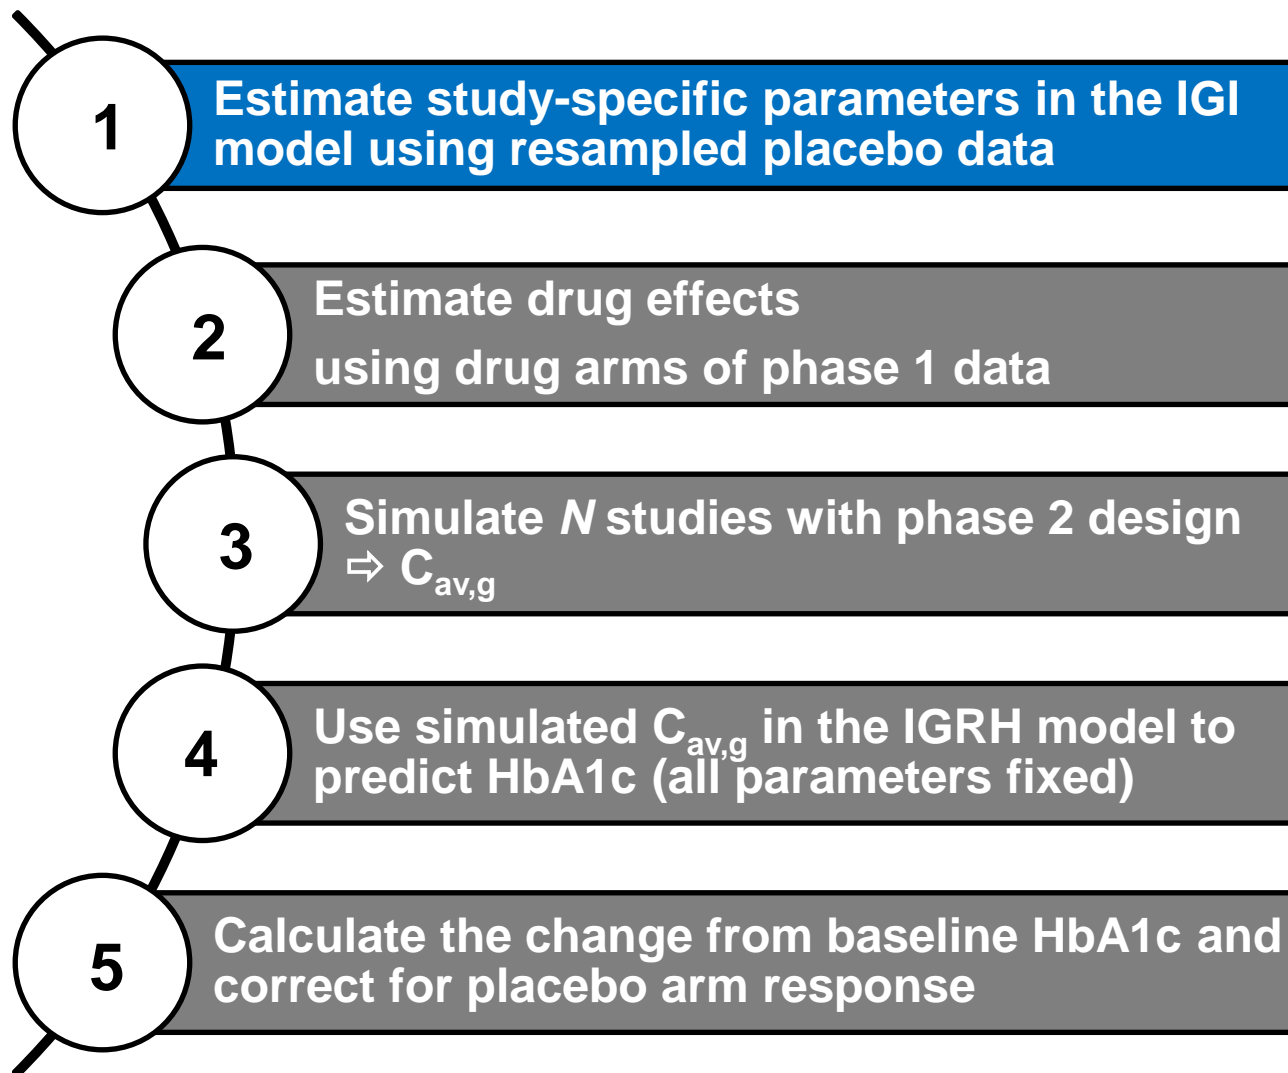

## Create Ph2 population from Ph1 data

Sample with replacement from baseline FPG in Phase 1 study (mean: 151) to mimic baseline FPG distribution of Phase 2 study (mean: 177).

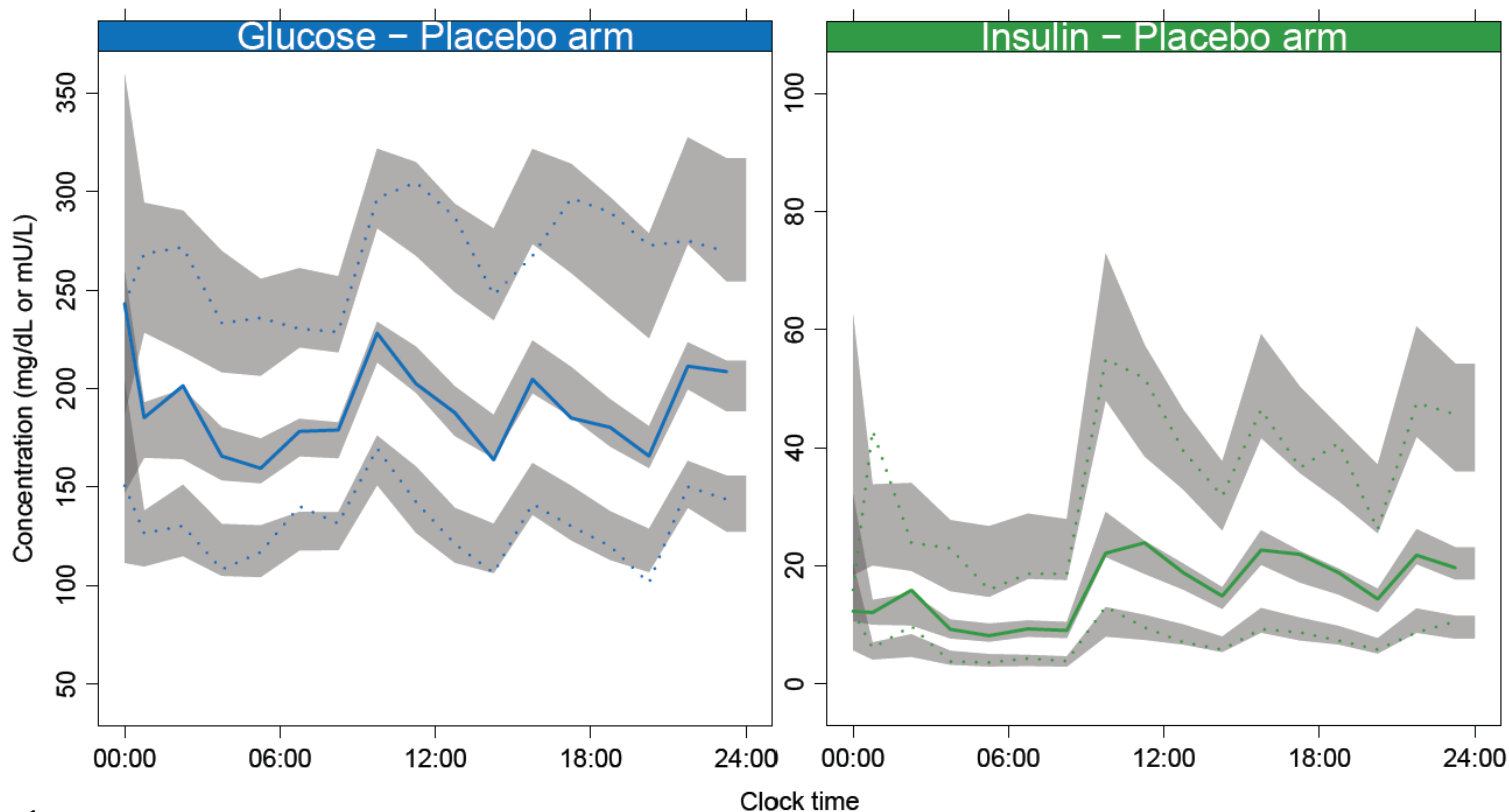

## Step 1 – Placebo model

## Step 1 – Placebo model

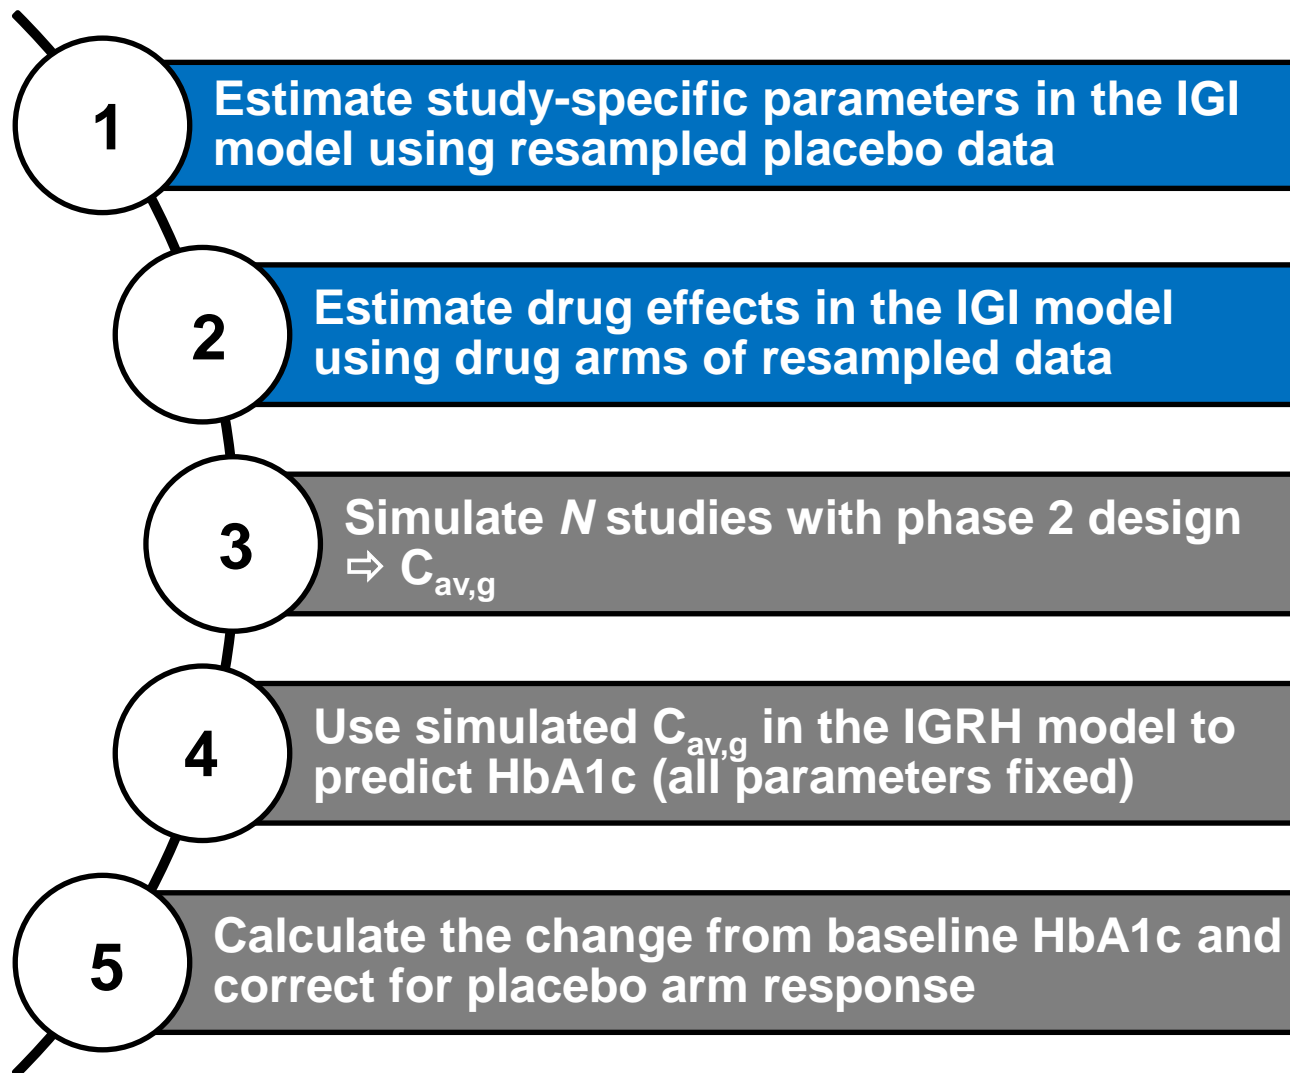

### pVPC<sup>1</sup> of daily glucose and insulin for placebo arm

<sup>1</sup> Prediction corrected

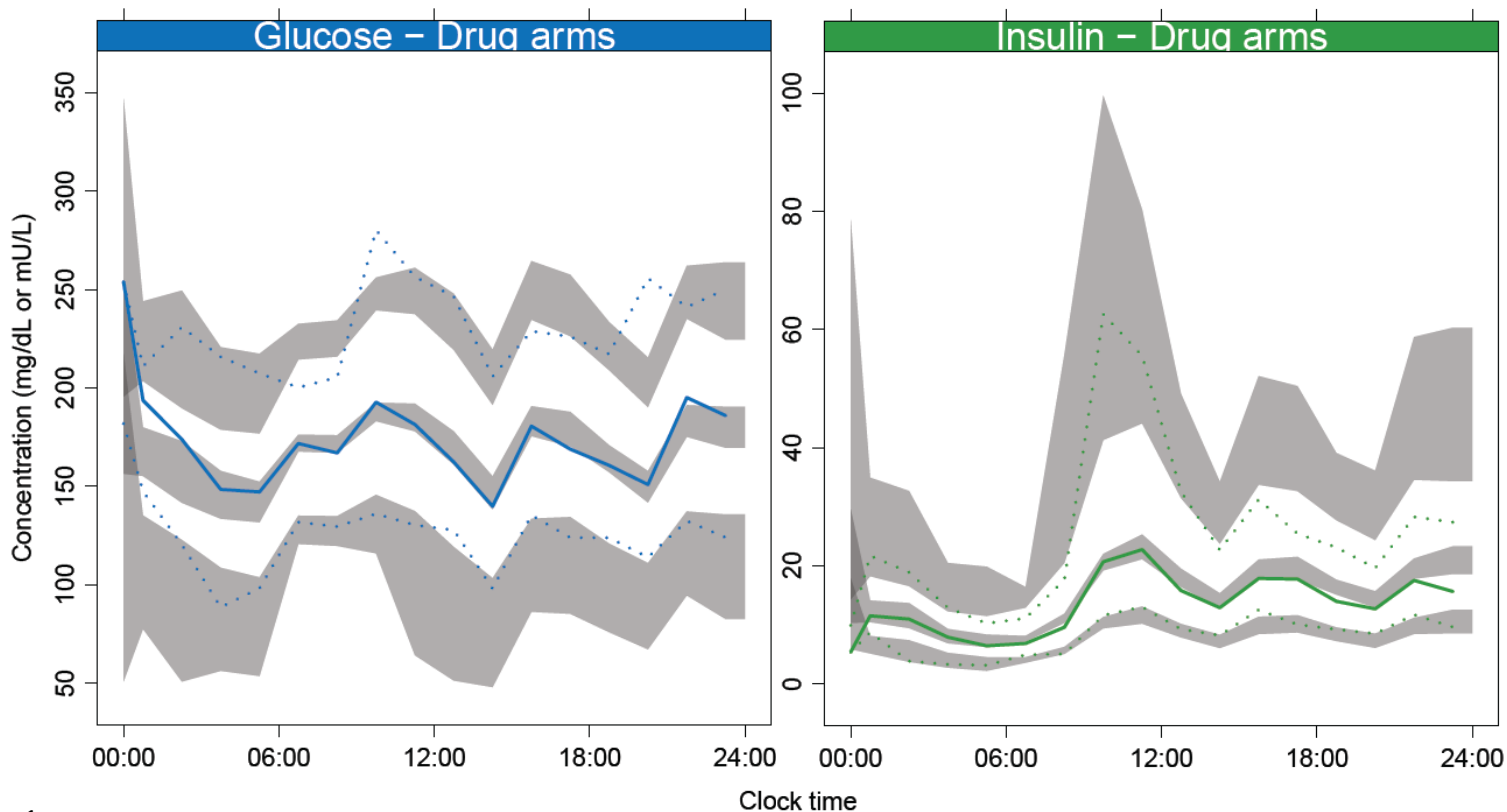

Bergstrand M et al (2011) AAPS J, 13: 143-51

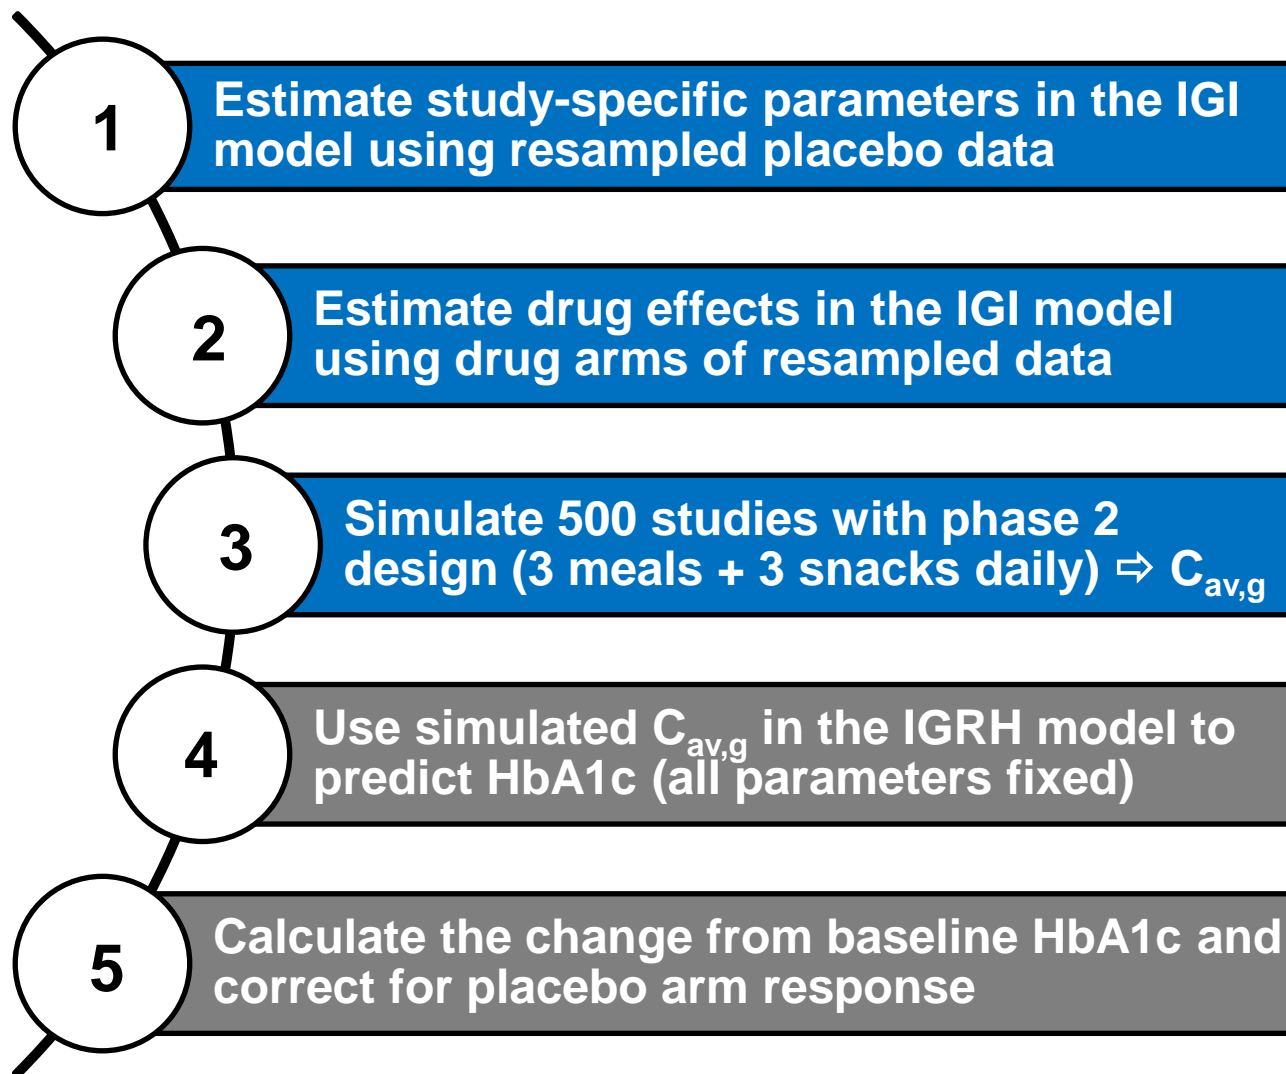

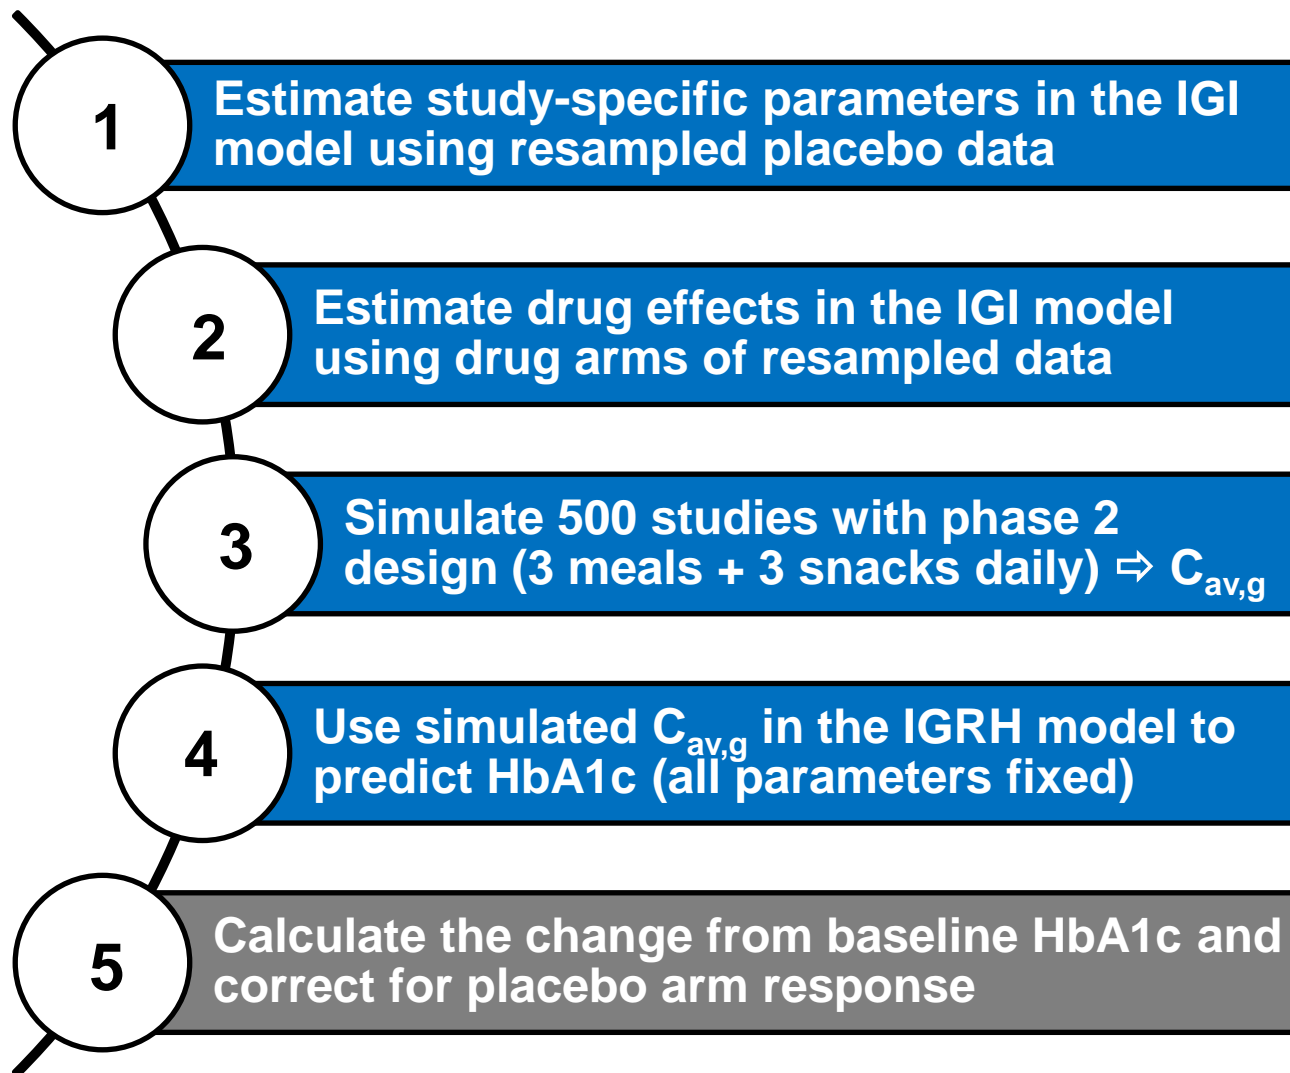

### pVPC<sup>1</sup> of daily glucose and insulin for drug arms

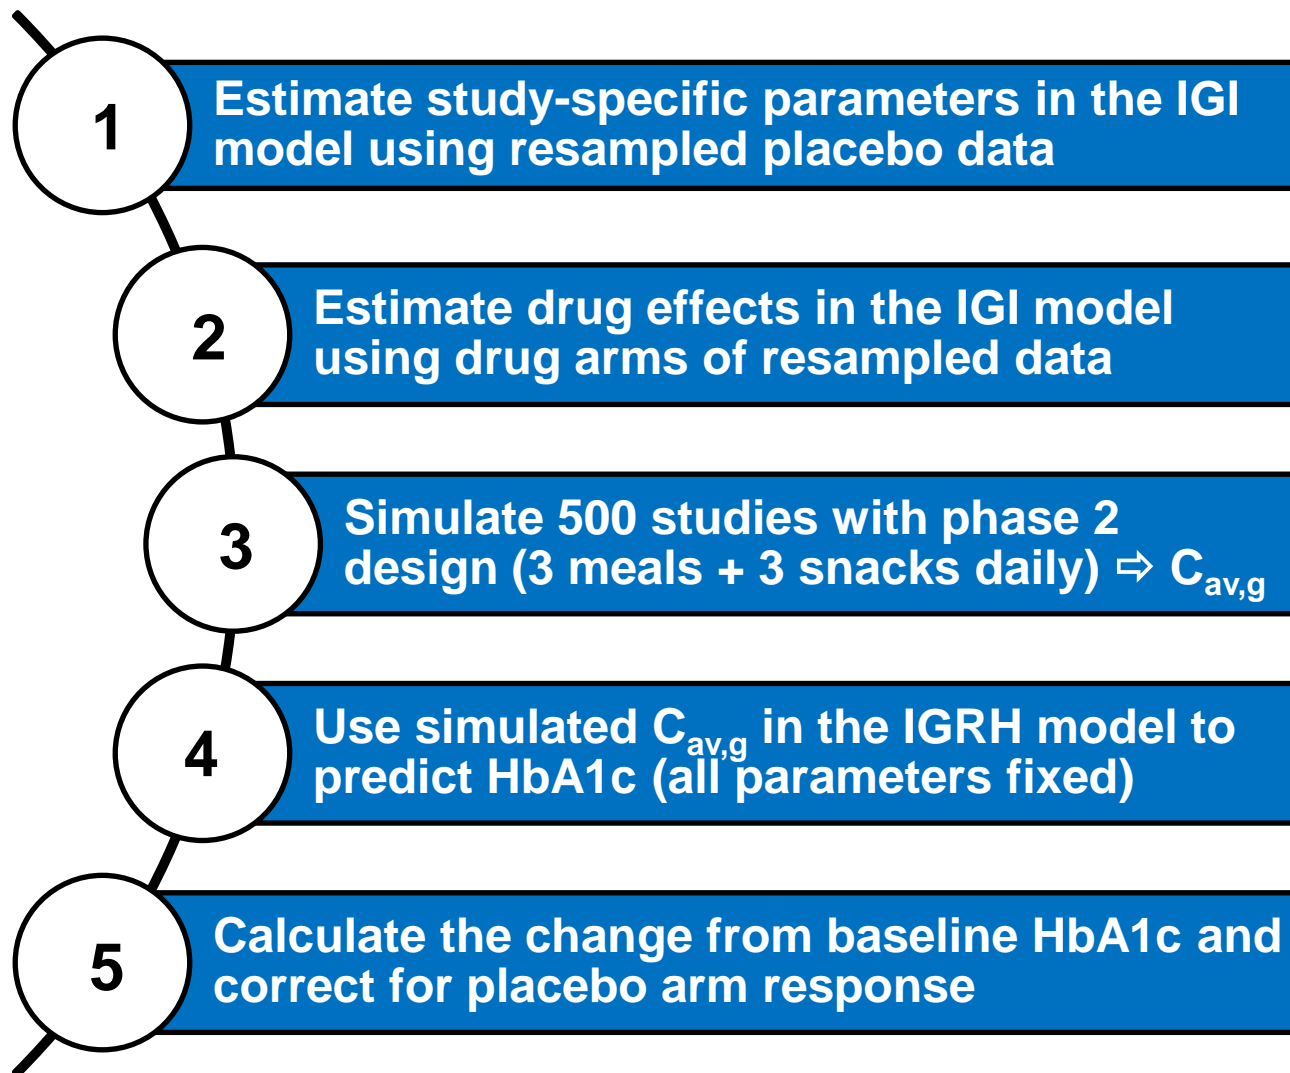

<sup>1</sup> Prediction corrected

Bergstrand M et al (2011) AAPS J, 13: 143-51

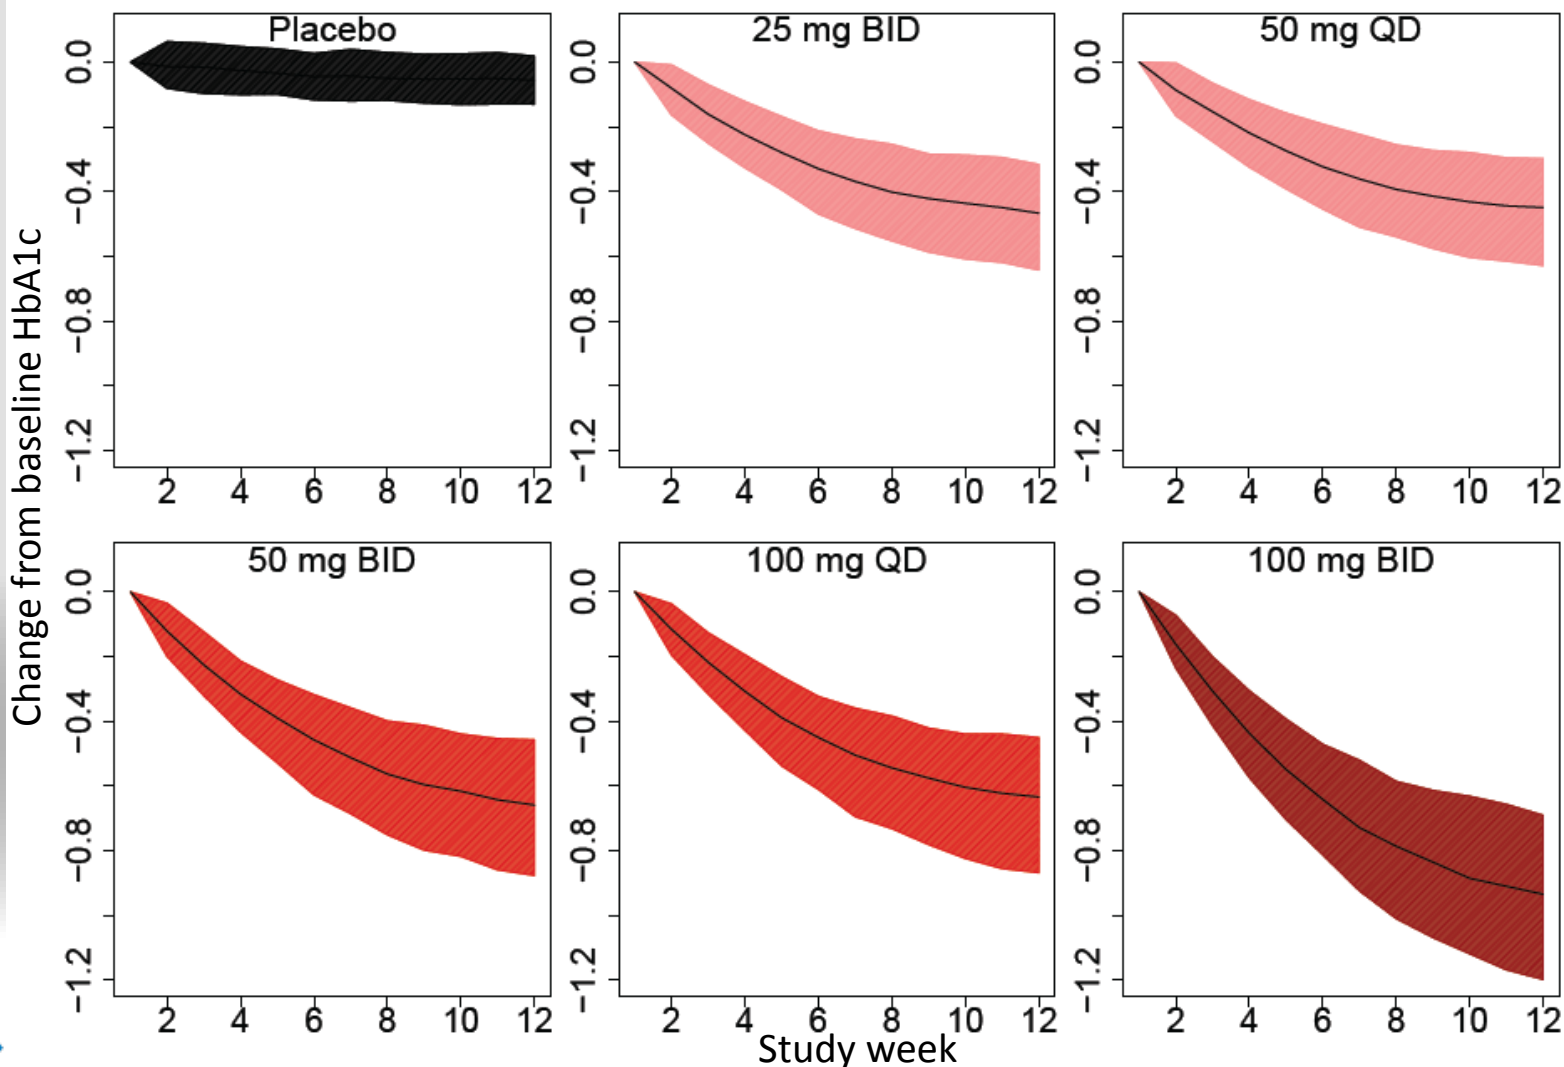

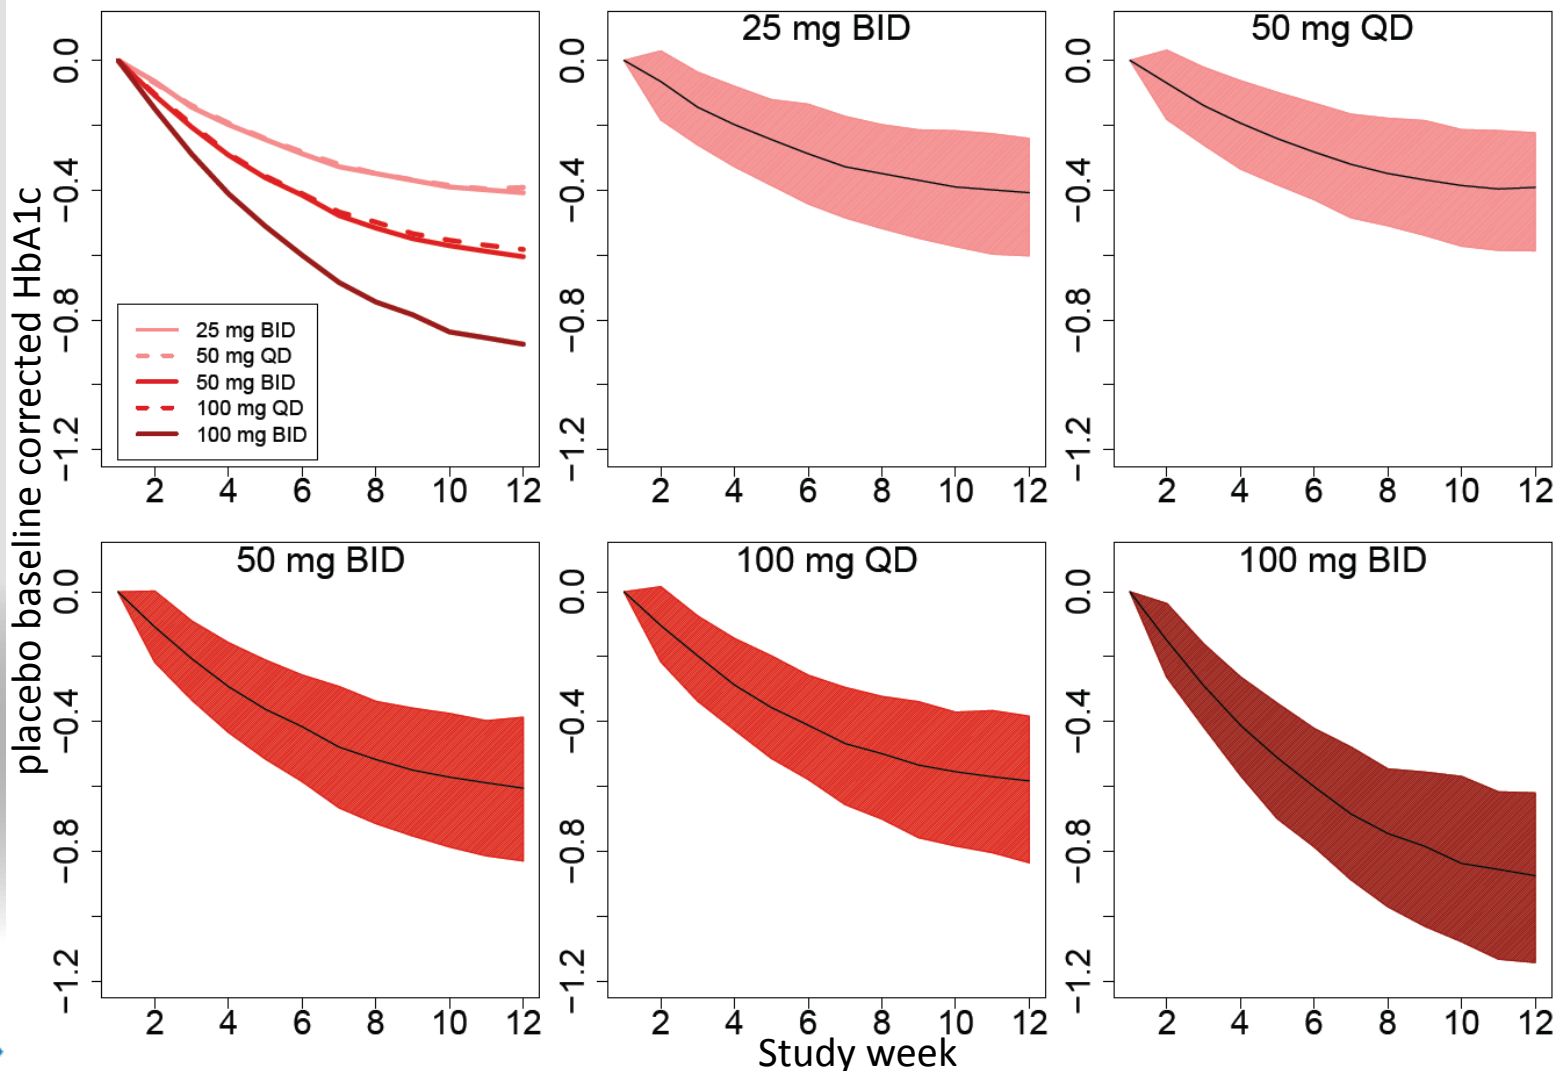

## Step 5 - Longitudinal HbA1c predictions

## Step 5 - Corrected HbA1c predictions

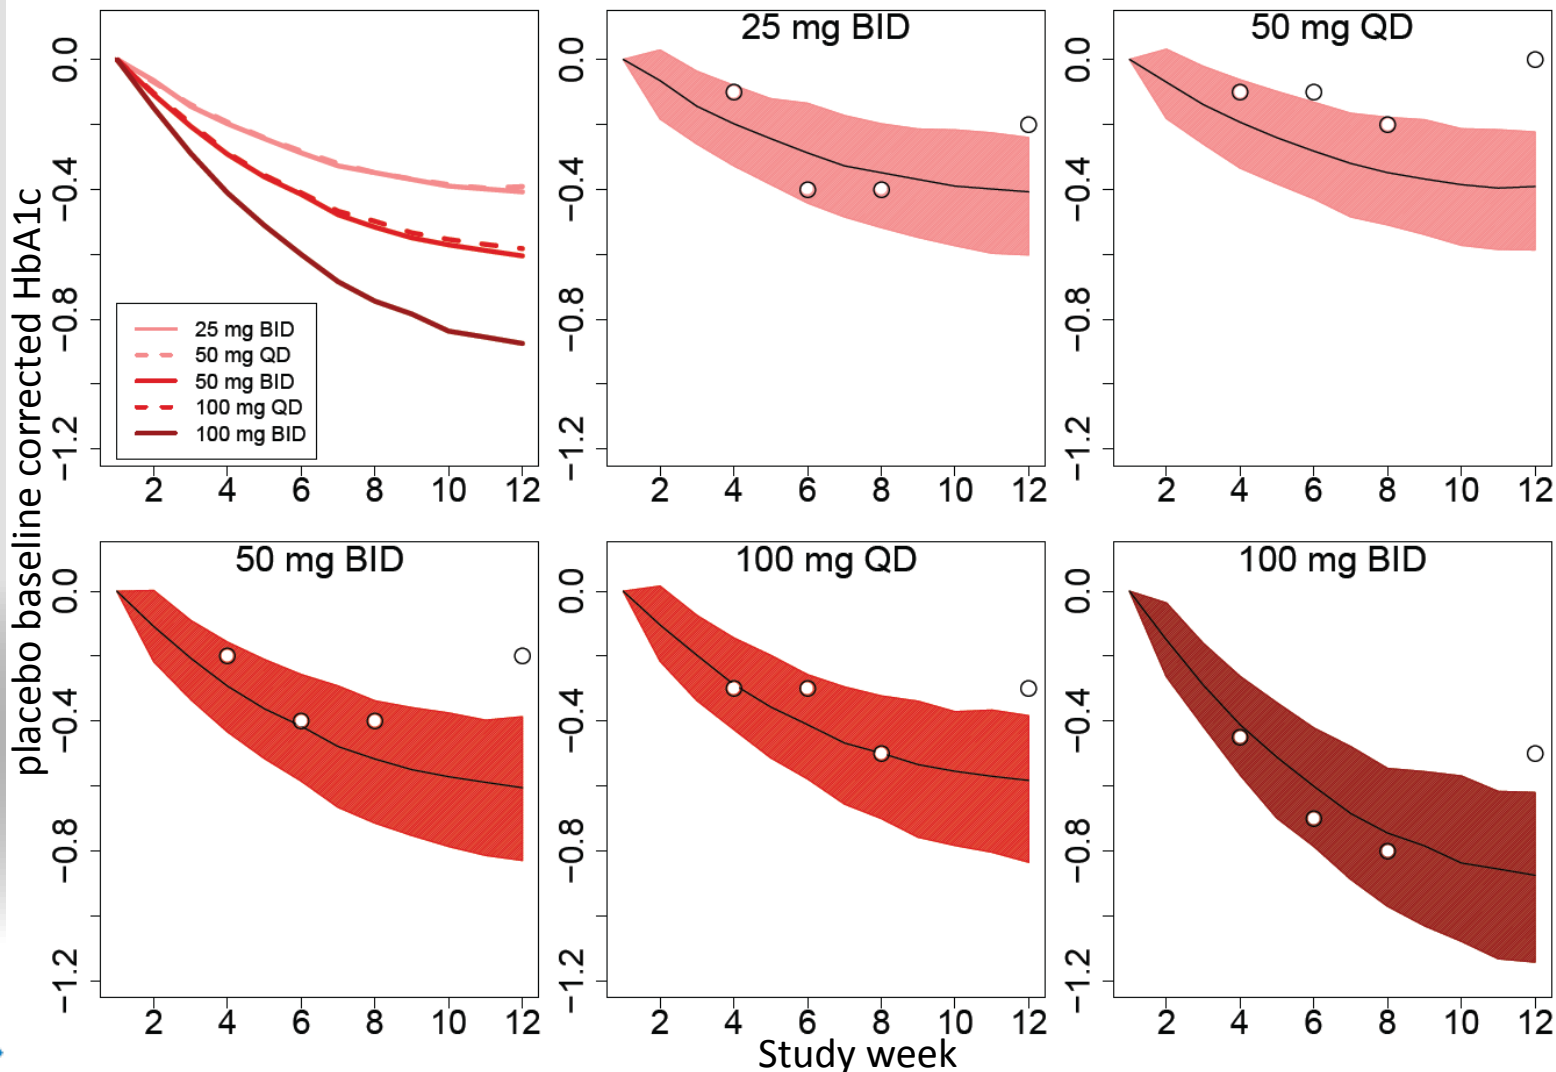

UPPSALA  
UNIVERSITET

## Step 5 - Corrected HbA1c predictions

UNIVERSITET

## Actual phase 2 outcome

Hazard of looking at change from placebo!

The model-based approach to predict the dynamic HbA1c up to 12 weeks using information gained in earlier provocation study with glucose and insulin measurements was proven to reasonably well predict the outcome.

Despite ignoring

- Add on to metformin – potential overlap of mechanism
- Disease progression model
- Drop-out and deviations from protocol (e.g. change in diet)
