

# Prediction of pharmacokinetic interactions for drugs with a long half-life

## *Evidence for the need of model-based analysis*

# Importance of drug-drug interactions

## Consequences

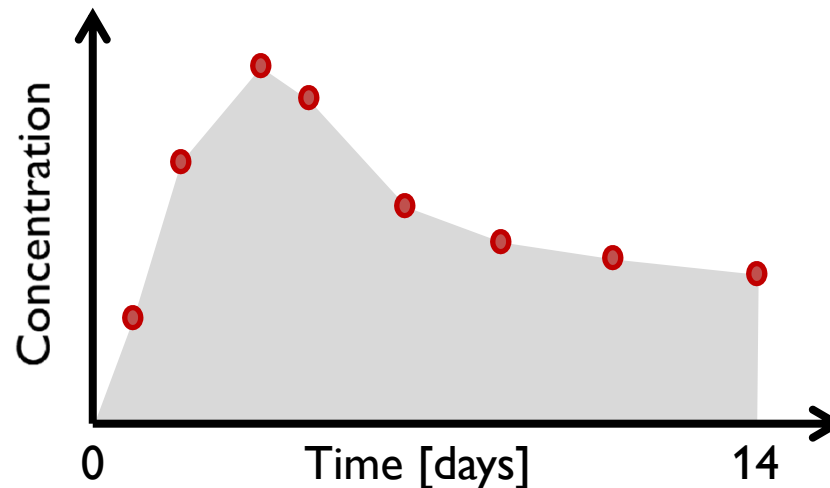

- insufficient efficacy
- excessive toxicity

## Remedies

- accurate predictions
- rational dose adjustments

# Predicting PK DDI

- DDI study design: single-dose crossover<sup>[1,2]</sup>
- Non-compartmental analysis (NCA)
- AUC &  $C_{\max}$  of victim drug w/wo perpetrator drug
- Geometric mean of ratios (GMR) reported

Background

# Objective

**Case:** Drug-drug interactions for drugs with long  $t_{1/2}$

- Summarize experiences
- Simulation study
  - Evaluating standard methodology (NCA)
  - Demonstrate benefits of a model-based approach and factors influencing its informativeness

## Example: Bedaquiline (BDQ)

- Recently approved anti-tuberculosis drug
- Substrate of cytochrome P450 3A4
- N-demethylation to M2
- Terminal  $t_{1/2}$  ~5.5 months

# DDI study design

## BDQ DDI studies

- efavirenz
- nevirapine
- rifampicin
- rifapentine
- lopinavir/ritonavir

# Simulation study

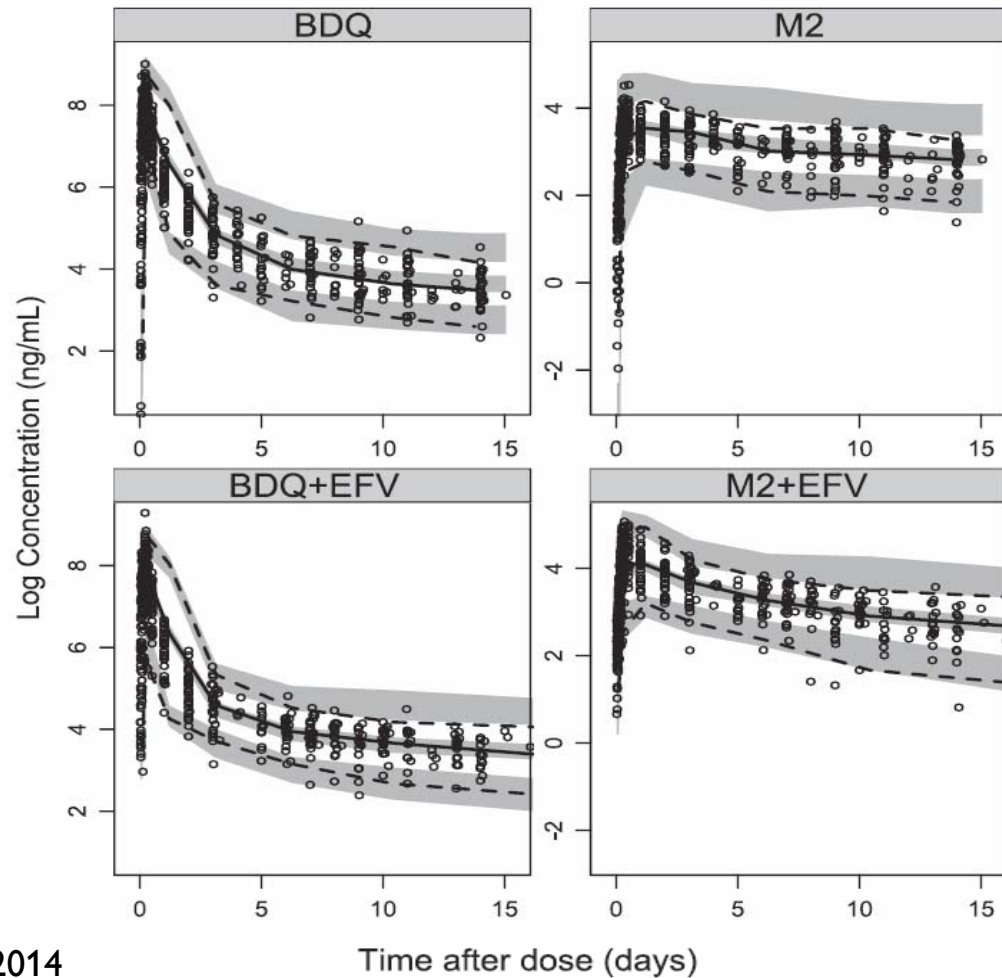

## Clinical data

PopPK model of  
BDQ and M2 with  
efavirenz DDI

Svensson *et al.*  
AAC, 57(6) 2013

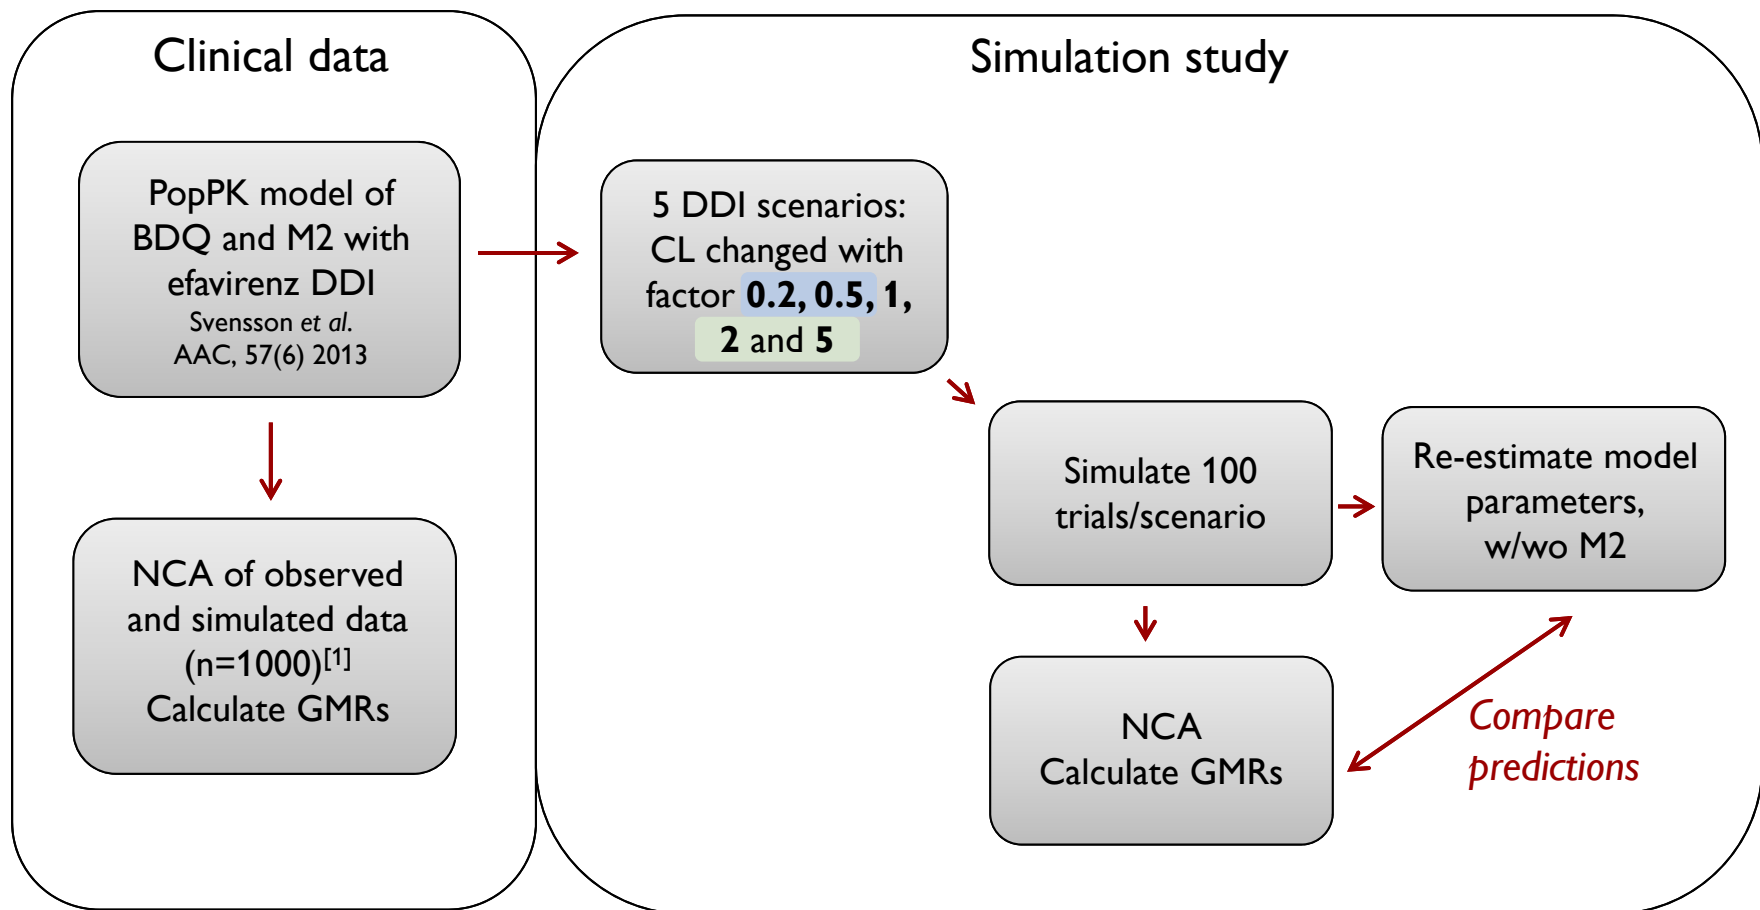

NCA of observed  
and simulated data  
(n=1000)<sup>[1]</sup>  
Calculate GMRs

[1] Acharya *et al.* PAGE 23, Abstr 3103, 2014

# Simulation study

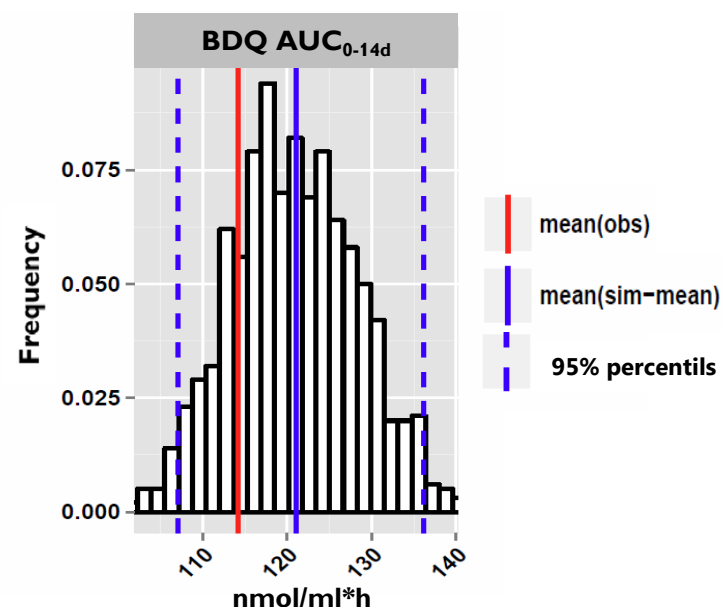

[1] Acharya et al. PAGE 23, Abstr 3103, 2014

## Results

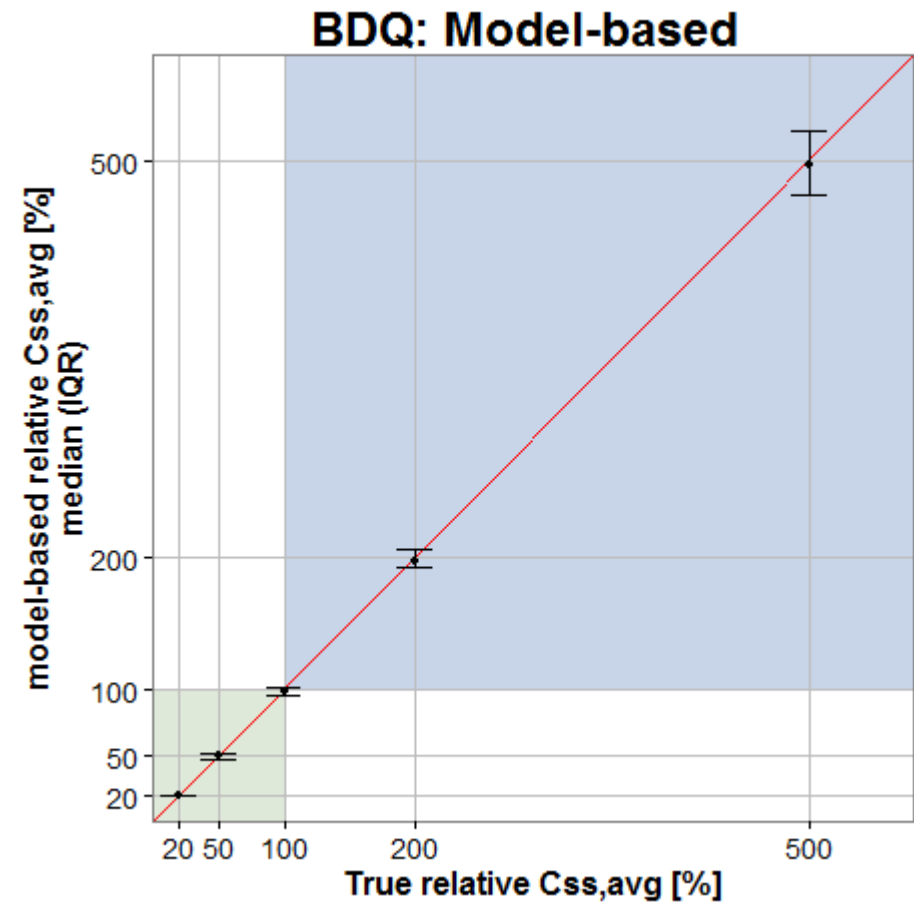

# NCA on observed and simulated data

- Factor change in BDQ and M2 CL with EFV: **2.07**  
→  $C_{ss,avg}$ : **48.3%** of normal
- Mean  $AUC_{0-14d}$  of observed and simulated data in good agreement

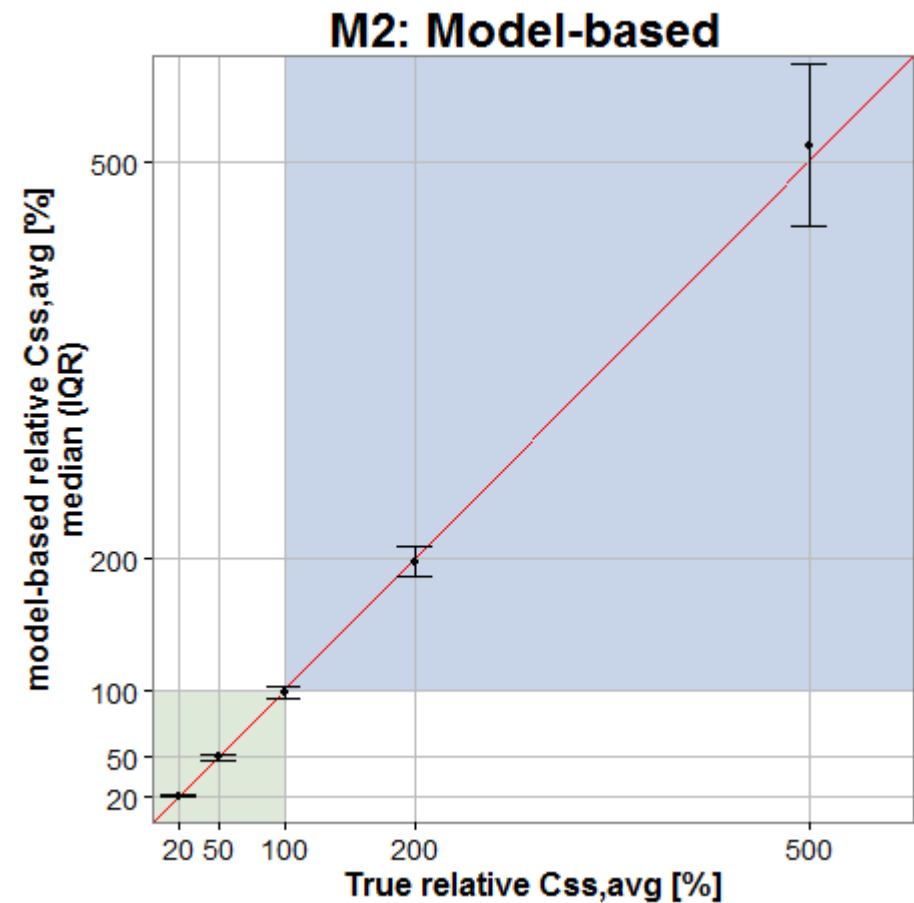

| Exposure GMRs | Observed data | Simulated data median (95% CI) |
|---------------|---------------|--------------------------------|
| BDQ           | 86.8%         | 78.5% (69.9-88.5%)             |
| M2            | 128%          | 120% (107-134%)                |

# Simulation study: BDQ

# Simulation study: M2

# Reasons for biased predictions

- Small part of total AUC observed
- The observed part changes with the interaction

| Factor change in<br>CL | BDQ<br>$AUC_{0-14d}/AUC_{inf}$ | M2<br>$AUC_{0-14d}/AUC_{inf}$ |
|------------------------|--------------------------------|-------------------------------|
| 0.2                    | 15%                            | 3%                            |
| 0.5                    | 31%                            | 12%                           |
| <b>1</b>               | <b>48%</b>                     | <b>29%</b>                    |
| 2                      | 65%                            | 54%                           |
| 5                      | 83%                            | 81%                           |

## Results

# Summary BDQ DDI predictions

| Perpetrator drug           | NCA prediction           | Model-based prediction    |
|----------------------------|--------------------------|---------------------------|
| efavirenz                  | - 18% <sup>1</sup>       | - 52% <sup>4</sup>        |
| nevirapine                 | No change <sup>2</sup>   | No change <sup>5</sup>    |
| rifampicin                 | - 59% <sup>3</sup>       | - 79% <sup>6</sup>        |
| rifapentine                | - 57% <sup>3</sup>       | - 75% <sup>6</sup>        |
| <b>lopinavir/ritonavir</b> | <b>+ 22%<sup>2</sup></b> | <b>+ 188%<sup>5</sup></b> |

## Results

# Value of metabolite data

**Standard error of parameter for interaction effect**  
on BDQ CL estimated without M2 data

- Simulation study: **2- to 6.5-fold** increased
- Clinical data: **5-fold** increased

**Increasing precision!**

## Conclusions

# Need of model-based analysis

- Avoid biased predictions
    - Underestimating impact of interaction
    - Risk of wrong decision regarding dosing
  - Accurately account for carry-over
  - More mechanistic
  - Make use of metabolite data
    - Better precision → smaller studies
  - Simulate dose adjustments
- 
- Update regulatory guidelines about analysis of DDI studies

*True  
regardless of  
half-life!*
